The Leading Magazine Of Home, Educational, And Recreational Computing

A Survey Of Inexpensive Printers

SON OF STARWRITER

STARWRITER CPS

First there was the Starwriter 40 CPS by C. Itoh. one of the world's most popular letter-quality printers.

And deservedly so Because it gives you more of just about everything than any other printer in its price range limid teens. And it churns out copy at a very brisk 40 characters per second, or about half a minute for an average business letter.

Now, there's the Starwriter 18 CPS". It takes after its father in that it's simply the finest printer you can buy for anywhere near the price which in this case is just about half what Daddy charges. The only major difference is speed:

Instead of 40 characters per second, this Starwriter trots along at just over 18 cps—which costs you about 30 seconds per average business letter

But it retains the rest of the family resemblance, like low profile and low noise, plug-in compatibility with just about any serial or parallel microcomputer on the market, making it a perfect companion in a typical office environment.

And perfect for typical office chores like letters, memos, announcements—in fact the vast majority of stuff that can afford to wait a few seconds to get typed

Enough said?

If not, then this, the
Starwriter I8 CPS gives you
crisp, letter-quality copy (including boldface, underlining sub
and superscripts) with your
choice of friction feed or
optional fractor feed for precise
print positioning of tabular and
graphic data, using easily available industry-standard ribbon
cartridges and long-lasting
plastic daisy wheels.

But it also gives you something that's far from industrystandard

A full-year warranty.

And for a mere half-a-minute per letter.

We think it's well worth the wait

Marketed exclusively by Leading Edge Products, Inc. 225 Turnpike Street, Canton, MA 02021, 1-800-343-6833 or in Massachusetts (617) 828-8150.

WordPro 3 Plus™/64 and SpellRight Plus™ provide a total word processing solution for the Commodore 64™ which gives you:

- * Sophisticated Word Processing
- * Built-in Mail Merging for Form Letters
- Math Functions for Column Totals
- Fast and Complete Spell Checking via SpellRight Plus
- * A Super Value (two programs) for Only \$99.95!

WordPro and SpellRight are both specifically designed for the novice user with no computer or word processing experience whatsoever. And with over 40,000 WordPro versions sold, you can be sure that WordPro is a very sophisticated word processor loaded with powerful features including: Transfer, Insert, Delete, and Rearrange Text, Auto Page Numbering, Math Functions, Headers, Footers, Global Search and Replace, the Ability to Create Multiple Personalized Letters and Documents, and much more. WordPro can create documents of virtually any length and will print up to 165 columns wide. You get all of this PLUS fast and complete spell checking using SpellRight Plus!

SpellRight Plus locates and highlights misspelled words and then allows you to quickly correct the misspellings — improving the quality of your letters and reports.

And, best of all, WordPro and SpellRight's powerful arsenal of features can be put to use almost immediately — by even the novice user. So whether you're a student, professional writer, in business, education or a hobbyist, you'll quickly become a WordPro Pro!

Both WordPro and SpellRight Plus are also available separately at popular computer outlets nationwide.

Invest in the best . . . WordPro Plus. In a class by itself.

Dealer and Distributor inquiries are invited.

You bought a computer to cultivate your kids' minds.

Make sure it's bearing fruit, not growing vegetables.

Introducing a whole crop of Learning Adventure games from Spinnaker.

When it comes to cultivating adventurous young minds. the computer's potential is endless.

Unfortunately, the search for software that makes the

most of that potential has been endless, too.

That is, until Spinnaker created the Learning Adventure Series. A unique collection of games that reward curiosity with hours of adventure and learning. So the time kids spend with our games will help them develop valuable skills. Instead of just tired thumbs.

But what really makes our Learning Adventure games unique – educational value aside – is how much fun they are. Which isn't too surprising when you consider you can do things like bargain with aliens, search a haunted house, or build your own railroad empire. In fact, our games are so much fun, kids will really enjoy developing some very important skills. Deductive reasoning, note taking, and problem solving, for instance.

So, if you're in the market for software that truly cultivates young minds, pick the Spinnaker Learning Adventure Series. It's the best way to be sure your search will be fruitful.

Spinnaker Learning Adventure games are available for Apple.* Atari.* IBM* and Commodore 64 ** home

It's New! ADVENTURE CREATOR."

Design a challenging adventure game that you or a friend can tackle - or let the computer design one for you. It's complex, exciting-and utterly addictive! Ages 12-Adult.

IN SEARCH OF THE MOST AMAZING THING.™

It isn't easy to find — even in your B-liner. But you'll have help from your Uncle Smoke Bailey as you search the universe to find the Most Amazing Thing.

Ages 10-Adult.

SNOOPER TROOPS™ CASE 1 & CASE 2.

Can you solve the mystery of the Granite Point Ghost? Or find the Disappearing Dolphin? You'll have everything you need – but it's up to you to solve the case! Ages 10-Adult.

All the hits your computer is missing.

If you thought you'd never find fun games for your hardworking home computer, happy days are here. Because now ATARISOFT™ has all the great hits...Pac-Man!, Donkey Kong² by Nintendo², Centipede;™ Defender³, Joust³, Jungle Hunt¹, Moon Patrol³, Pole Position⁵, Galaxian¹, Ms. Pac-Man!, and Battlezone.™

And we've got them for all the hit computers ... Apple, IBM, Commodore 64, Vic-20, Colecovision,* and TI 99/4A. We've got Pac-Man, Centipede and Defender for Intellivision too.

So dust off your joystick and ask your dealer for all the ATARISOFT hits. It's the software your hardware's been waiting for.

ATARISOFT.

All the hits your computer is missing.

ATARISOFT products are manufactured by Atari, Inc. for use with various computers and video game consoles. ATARISOFT products are not made, licensed or approved by the manufacturer(s) of these computers and video game consoles. *Donkey Kong and Battlezone not available on Colecovision. 1. EDITOR'S NOTES

Apple, in an extravaganza at San Francisco's Moscone Center yesterday, formally introduced their new personal computer, the Apple IIc. Discussion with over one dozen dealers revealed a reaction which was uniformly positive, with the only concern being, "What about the Apple

Significantly, Apple's massive entry into the home and educational computing market, backed by an initial advertising push in excess of \$15 million is being handled by their existing dealer network. While some units will be sold through department store or chain outlets, the majority will flow, unbundled, through Apple's dealer group. The rationale given for not bundling the system was that dealers would be better able to customize the system for prospective purchasers.

During the course of all of this, Apple revealed that they have now sold almost 2 million Apple II's since its introduction, and over 50,000 Macintoshes. By the time you read this, the external drive should be available for the Macintosh, and many dealers will have Apple Ilc's in stock... or at least flowing through their stores. Impressively, both of Apple's recent

major announcements have been coupled with the actual shipment of the computers being introduced.

Apple expects the IIc to be a forceful competitor in the home market, and stresses that the product is specifically targeted for the serious personal computer user. Will the IIc succeed? Pricewise, it's competitive with the high-end PCjr system from IBM. It contains the same amount of RAM (128K), and built-in BASIC in ROM (albeit a smaller version with less power than that in the Cartridge BASIC of the PCjr). The IIc has one built-in disk drive, a keyboard that's a bit more standard than the frequently criticized keyboard of the PCjr, and an available software library of over 10,000 Apple II programs that will be compatible with the IIc.

By the fall, Apple will be shipping a \$600 flat panel display for the IIc which will display 24 lines by 80 characters, and fully complement the already integrated design of the rest of the unit. The disk drive, for example, is built into the side of the combination computer/keyboard housing.

ProDOS, the operating system, is fully compatible with

Apple DOS 3.3, and with a very minor change, DOS 3.2. Almost two dozen leading software vendors were exhibiting products for the IIc at the introduction, and Apple indicates that it's working with more than 100

vendors at present.

Has Apple come home? For now, it certainly appears that way. You can anticipate a rapid expansion of COMPUTE!'s editorial coverage to include the industry's latest entry into the field of home and educational computing. Next month we'll have a full feature on the IIc, and further analysis of its future.

Until then, enjoy your issue.

Editor In Chief

The Rammaster™32 introduces you to the world of more powerful computing. Now VIC 20[®] owners have one of the most advanced memory devices available. It's what you'd expect from MOSAIC MEMORY. This is a full service memory device. Not only will the Rammaster™give you 7 times the computing RAM power (as much usable memory as the Commodore 64%) but also many advanced features.

The expansion port allows you to use your cartridges without unplugging

EXPANSION

PORT

GOLD EDGE

CONNECTORS

the memory board, saving wear and tear on your computer. It's much more effective. With the flexibility the Master Control switches give you, you'll have no need for a mother board. The Write Protect switch protects your programs' subroutines and data from accidental interference from basic language and the automatic erase built into some cartridges. There's a pause switch built in to stop in the middle of a program, plus an external port is

built in for a convenient optional cable pause/reset switch. You even have a switch to overlay a 3K block of RAM for

expansion to 40K. The Master Control gives you complete control over the configuration of your VIC 20 Memory Map so it will never become obsolete.

The Rammaster™ 32 is completely compatible with all the VIC 20 products and programs, and will be the most useful peripheral you'll buy for your VIC 20° computer. With MOSAIC MEMORY expand your

experience into more powerful computing.

\$129.95

READERS' FEEDBACK

The Editors and Readers of COMPUTE

How To Turn A Computer On

I have a question concerning peripheral equipment. When first turning on the computer equipment, I've heard that it is advisable to turn on the accessories first and the computer last. Is it okay to have all three units (computer, disk drive, and printer) plugged into a single power strip, and turn everything on at once merely by turning the power strip on?

Robert C. Leuten

No. Computers, and electronic equipment in general, often have circuits that protect against damaging surges of power when equipment is first turned on. By leaving all your equipment on and turning on the power strip, you defeat this circuitry. This could damage your equipment.

Also consider that the more devices on the power strip, the bigger the initial surge will be. So generally, it's a good idea to turn on each piece of equipment in the proper order, one at a time.

Another commonly asked question is, "In what order should I turn on the computer equipment?"

The Commodore 1541 disk drive owner's manual states that the computer should always be turned on last. Since the printing of that manual, Commodore has issued an update bulletin concerning the proper order for turning on the computer and its peripheral devices. Here are their recommendations:

- 1. Computer, disk drive, printer
- 2. Computer, disk drive, disk drive
- 3. Computer, disk drive, disk drive, printer

Variables In Atari Filenames

Is there any way you can assign a filename to A\$, and then open an Atari disk file named A\$?

James Beach

Sure. Let's say someone INPUTs the name into a string:

> 10 DIM T\$(40), A\$(20) 100 PRINT "Filename": INPUT T\$

You can then create a disk filename:

110 A\$ = "D:":A\$(3) = T\$

now we OPEN the file, for read access:

120 OPEN #1,4,0,A\$

Disk Drive Door Dust Defense

I own a 1541 disk drive, and I would like to know if I should keep the disk drive door closed when it is not in use. I have read that if you keep the door closed, it will prevent dust from getting into the drive. On the other hand, I've also read that keeping the door closed also keeps the read/write head down, and the constant pressure will damage the head. Which would be better?

Ierrell F. Schivers

There is no compelling argument on either side of this debate. The pad that the read/write head rests on is soft, and shouldn't damage it with the door closed. On the other hand, dust can still find ways in with the door closed.

Tokenized Commands In TI Extended BASIC

Recently, I was working in Extended BASIC on my TI-99/4A and found that I could enter commands while in programming mode using the CTRL key. For instance, holding the CTRL key and pressing; produces the PRINT command after the line is LISTed. (Note: This won't work in immediate mode or in console BASIC.)

As it turns out, most keys in conjunction with the CTRL key produce a command. I've also discovered that only one such command can be entered per line in this fashion. Can you tell me the significance of all this?

Steve Hayner

Like most computers, TI represents its BASIC commands internally in a tokenized, or numerically-coded, abbreviated form. Apparently, certain keystrokes generate the same codes as some tokenized commands.

This technique is indeed limited to the Extended BASIC programming mode. Also, as you say, only one command can be entered per line with this method. These severe limitations, along with the absence of documentation in the TI-99/4A reference manuals, lead us to believe that the use of tokenized commands in this manner is allowed through a quirk in the system. They are probably not a design feature. Regardless, the method that you've described does offer a shortcut for entering commands in certain instances

RESTON MAKES THE ATARI CHILD'S PLAY

Reston Computer Group" A Prentice-Hall Company 11480 Sunset Hills Rd. Reston, VA 22090

Available at your local bookstore and computer retailer, or call us at (800) 336-0338.

ATARI, ATARI PILOT, ATARI LOGO and ATARI 400, 800, 600XL and 800XL are registered trademarks of Atari, Inc. Reston has the books which make learning to program Atari™ computers fun.

HELLO, COMPUTER: AN INTRODUCTION TO BASIC, by Lawrence P. Huelsman, can help both teen and adult beginners learn BASIC on many computers, including Atari", using

drills, programming problems, games, cartoons and an easy conversational style.

SURVIVAL ON PLANET X WITH THE ATARI" HOME COMPUTER, by Orkin and Bogas, uses the exciting adventures of Vivian on Planet X to teach kids basic

programming concepts and techniques. The fun is interspersed with short programs, illustrated by noted animator Bud Lucky.

ATARI" LOGO ACTIVITIES, by Steve DeWitt, provides over 150 activities which encourage young and old alike to be inventive and creative when using Atari Logo" educational language. The book includes five big projects and an in-depth discussion of Logo."

ADVENTURES WITH THE ATARI", by Jack Hardy, teaches you how to write adventure games in Atari PILOT" Microsoft BASIC, and BASIC. It includes six actual adventure games

to study, type in, and play, plus tips and techniques to help you create your own.

A+ PROGRAMMING IN ATARI" BASIC, by John Reisinger, is a selfstudy workbook which gives you step-by-step instructions for BASIC programming on the Atari 400, 800, 600XL

and 800XL" computers. Stressing top-down programming in a fun and friendly manner, this book is perfect for school, workshop and computer camp.

If you want to make learning about Atari™ computers fun, then make Reston the teacher.

We've found that a few tokenized commands can also be keyed in with the FCTN key. Here's a list of the CTRL- and FCTN- keystrokes, and the commands they access:

Key	Command	Key	Command
CTRL1	TO	CTRLD	IF
CTRL 2	STEP	CTRLF	GOTO
CTRL8	OPTION	CTRL G	GOSUB
CTRL9	OPEN	CTRL H	RETURN

CTRL A	ELSE	FCTN/	OR
CTRLS	DATA		

Modifying The Atari 400 Monitor Cable

I have owned an Atari 400 for a little more than a year now, and I'm considering the purchase of a monitor. The monitor I want to buy has an RCA-type jack, but my computer doesn't. Is there a way I can hook up a monitor to my computer without any extra cables?

Davy Wong

It's not that simple. The 400's video output is designed to work with a television set. The signals generated by the RF modulator won't drive a monitor. Hooking up a monitor would require rerouting the 400 circuitry to bypass the RF modulator, or installing a device to convert the modulator's signals.

Protected Disks

What exactly is the difference between writeprotected and copy-protected disks? Can these protection devices be evaded on disk? Also, if my friend buys a program on disk, is there any way to transfer it to tape for me?

Jon Regen

Write-protected disks are disks that can be read from, but not written to. As you hold a disk in the normal fashion, and slip it into your disk drive, you'll notice a little square notch cut out of the left side of the protective sheath. Inside your disk drive are a light-emitting diode and a phototransistor.

These two components are in-line with each other, and when you insert a disk, the light from the LED shines through the notch and into the phototransistor. If the transistor detects the light, then the drive is allowed

to write to the disk.

To write-protect a disk, place one of the sticky tabs included with the disk over the square hole. This will stop the light from reaching the phototransistor, and signal the drive not to write to this disk. An attempt to write will cause the red error light on the front of the drive to blink.

Copy protection is a different matter. More often than not, commercial software is copyrighted. This means that you may not (under penalty of law) make a copy for any purposes other than specified by the software distributor. Software manufacturers use several different methods to prevent copying, from different programming techniques to special coding on the diskette.

As for making a tape copy of the programs, the same answer applies. The copyright laws cover all copies, whether on tape or disk. Copies should not be made unless permitted by the software company.

Gotcha! Champions

My family has a VIC. This week we have been playing "Gotcha!" (COMPUTE!, February 1984) and I managed to get to the eighteenth screen. Since you mentioned that no one had reached this level yet, I thought I would let you know. When I got to the end it flashed yellow and said, "You made it!!!!"

Mark Crow

P.S. I am 11 years old, and I live in Cambridge, Ontario.

You said that no one has ever survived 18 rounds of "Gotcha!" Well, I did, and I have two reliable witnesses—my mom and dad. They saw me make 240 points and survive 19 levels.

I am 12 years old and I go to Grant Middle School in Springfield, Illinois.

Eric Jurgen

P.S. My dad thinks I fixed the machine.

Congratulations to both of you.

Disappearing VIC?

I own a VIC-20. I would like to know if Commodore has decided to stop making VIC-20s. If so, why? If they have, will you be able to buy Commodore software and hardware for it?

Jon Fedyk

We've received many inquiries about this. Commodore asserts that they do not now plan to stop production on either the VIC-20 or the 64. Commodore and third-party software and hardware for both computers should also continue to be available for some time.

As a point of interest, there are now two million VICs out there.

Picture yourself as the world's greatest superagent, Graham Crackers.

You must go undercover and sneak into an enormous art museum. Incredibly, it's a front for an international terrorist organization!

Your secret mission is to heist all the artwork in search of a classified microfilm. If you don't carry it off in time, the world is doomed!

Grab the keys to the 90 fiendishly boobytrapped rooms (144 in Apple). Brave the multitude of heart-stopping dangers as you make your

tortuous way through the deadly rooms. Test your cunning against overwhelming odds!

Chilling suspense and unknown terrors await you behind every door. You must evade maneating robots, monstrous stompers, sweeper drones and tons of falling boxes — and make death-defying leaps from moving platforms.

Only your artful handling of this dangerous assignment can save the world from destruction!

Choosing The Right Printer The Easy Way To Hard Copy

Selby Bateman, Features Editor

If you're thinking about buying a printer, remember that what you don't need in a printer can be as important as what you do. Save yourself time, money, and major headaches by following a few well-planned steps.

How can you choose the printer that's right for you? Listen to some experts:

"The most important thing you need to know when buying a printer is what in the world you're going to do with the thing," says Craig Ringuette, merchandising manager for Okidata. "That's the key. Once you know that, then there are clearly a lot of ways to be directed."

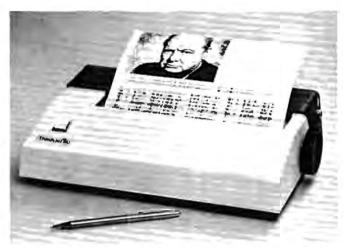

"You have to decide the quality of the print you want," states Rick Osgood, national technical support manager for Star Micronics. "Do you want dot matrix—which is going to print just draft quality—or do you require something a little better, like near-letter quality?"

"A buyer's first question will be, 'Will this work with my system?" says Charles Srogus III, product line manager for Micro Peripherals, Inc. "And the second question will probably be, 'Will it print graphics? Will it do the fun things I see them demonstrating on television or at the local computer fair?"

"You need to consider whether you want fully formed letter characters or whether dot matrix is adequate," adds Ken Bosomworth, president of International Resource Development, Inc., a market research firm. "And you should certainly think about whether or not you want color; and whether, if you get color, you can do anything with it."

Lower Prices, Better Quality

These printer manufacturers agree that buying a printer which works with your computer doesn't have to be a confusing or frustrating process. Lower prices and better quality are trends which have been accelerating during the past year. Computer owners now have a greater choice of reasonably priced printers than ever before. (See

Axonix Corporation's ThinPrint 80, a \$279, four-pound, battery-powered, portable, thermal printer that fits into one side of a briefcase and prints full-page text and graphics.

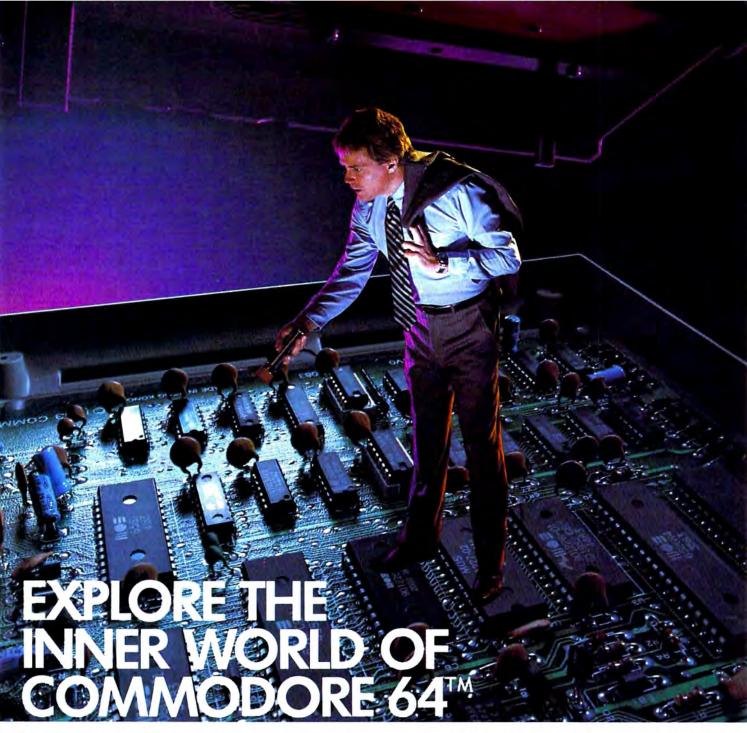

"The Inexpensive Printers Of 1984" in this issue.)

Computer printers are now a \$2.4 billion industry. Leading printer companies such as Okidata, Epson, Ricoh, Canon, Micro D (Abati), Micro Peripherals, Star Micronics (Gemini), Diablo, Axiom, Alphacom, and others are competing fiercely to make their printers the most versatile, dependable, and cost-effective.

But with so many choices, you need to have a basic understanding of what kinds of printers there are. Then define your specific needs.

The two most popular types of printers for microcomputers are the dot matrix impact systems and daisy wheel printers. Thermal printers are another category. There are also several newer types of printers—ink jet, thermal transfer, and laser—which are already beginning to affect the personal computer printer market.

Dot matrix printers are less expensive, and produce images on paper much like those displayed on your computer monitor or television set—patterns of dots arranged to form characters or graphic figures.

Whether you're a beginner or an experienced user, Reston can expand the world of the Commodore 64" for you.

COMMODORE 64TH COLOR GRAPHICS: A BEGINNER'S GUIDE,

by Shaffer and Shaffer, explains how the Commodore 64 operates and teaches you how to read, understand and write simple basic programs for generating color graphics. Each topic includes a BASIC programs, line-by-line explanations, and illustrations of what the screen should look like.

COMMODORE 64" DATA FILES, A BASIC TUTORIAL, by David Miller, is a step-by-step tutorial which takes the

mystery and misery out of creating files. You'll learn how to manipulate and create your own files for home, hobby, business, educational, and investment purposes.

ADDING POWER TO

YOUR COMMODORE 64", by Steve Cates and Vahe Guzelimian, uses a first-of-its-kind utility approach to help you master more of the advanced computing power of your machine than you ever though possible. You'll get an inside look at the workings and advanced features, all in an easy-to-understand style.

MASTER MEMORY MAP: COMMO-DORE 64 by Pavelko and Kelly, is a clearly written, friendly guide to all the Commodore 64'"'s memory locations — places inside the computer which act in special ways. You'll learn lots of special uses, including how to make music or create special characters for video games.

You can find these guided tours of the Commodore 64™ at your local bookstore or computer store. Or order directly from Reston at (800) 336-0338.

Stacked Wires That Strike

There are several types of dot matrix systems, the most common of which uses stacked wires that strike in various configurations against an inked ribbon to form characters on paper.

The early dot matrix printheads usually were limited to five wires horizontally by seven vertically. This resulted in crude, often difficult-to-read rectangular characters, with ill-formed descending arms on the letters q, y, p, g, and j, for example. More recently, more wires have been added, producing more fully formed characters.

Cardco's LQ/2 is a \$349.95 letter-quality portable printer which prints 12 characters per second, and has built-in interfacing for all Commodore personal computers. It is also compatible with the PC, PCjr, TRS-80, and other computers with parallel Centronics printer output.

A daisy wheel printer, on the other hand, has a printhead composed of formed characters which are located on the ends of spokes—or petals—emanating from a central, spinnable hub. The printhead looks like a high-tech daisy, hence the name. Daisy wheels leave an image very similar to a good typewriter, but print much more rapidly.

Closing The Gap

Daisy wheel printers generally are more expensive than dot matrix impact printers. And some newer dot matrix printers even rival the high-quality printouts from the daisy wheel printers.

Thermal printers actually burn off a coating on special thermal paper. Their costs are relatively low and their quality good. But thermal printers require special heat-sensitive paper, which is more expensive in the long run and subject to eventual decay.

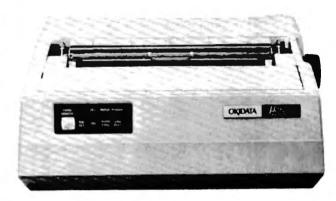

How Fast Is Fast?

Different printers operate at different speeds. Generally, the faster the printer, the higher the cost.

"At the entry level, you're looking at a lowend 100 to 140 characters-per-second (cps) printer, for anywhere from \$400 to \$600," says Star Micronics' Osgood. "That can go all the way up to a printer with 200 to 250 cps at upwards of a thousand dollars."

Do you need a printer that prints twice as fast as the low-end model, if that means you'll have to pay twice as much or more in order to get it? This is where the tradeoffs start, and a smart shopper will know what his or her needs will be.

"A printer is a very slow device—it's one of the slowest devices you'll hang on your system," says Osgood. "You'll want to take into consideration the amount of buffering a printer has (a temporary storage area in the printer into which the computer can dump your data). If you can only have a one-line buffer on the printer, then you're going to tie up your computer for a long time. If you have a 16K or an 8K or larger buffer, then you can off-load your data from the system in a much quicker time, freeing your computer to do other work."

Okidata's \$599 Microline 92 dot matrix printer can print 160 characters per second and, for correspondence quality, 40 characters per second.

Bidirectional And Logic-Seeking

In addition to sizable buffers, the faster printers put characters on paper both forward and backward rather than wasting the carriage-return time that occurs when a printhead must return to the left margin after each left-to-right pass. This is called bidirectional printing. Another advanced speed capability is logic-seeking, in which the carriage covers only the area of the line on which print is to appear rather than running from margin to margin on every return.

Okidata's Ringuette suggests that you ask, "Do I really need 200 or 300 cps? Is that important to what I'm doing? Can I live with 100 cps?"

The answer to those questions will be an important part of your decision on which printer you buy, he adds.

No Irreconcilable Differences

"Compatibility is another key issue," says

From Dot Matrix To Laser Print The Changing Face Of Printers

Selby Bateman, Features Editor

"Not too many people use horses and buggies anymore," says Jim Hafer, supervisor of product evaluations for Micro D, which markets the Abati LQ20 letter-quality printer.

Hafer thinks that changes in printer technology could challenge, and possibly even supplant, the present generation of dot

matrix and daisy wheel printers.

The staccato chatter of these impact printers appears to be giving way to the quiet hum of thermal transfer, ink jet, and laser printers. Recent advances in all of these technologies make their entry into the mass market a virtual certainty.

"It's probably going to happen a lot quicker than we expect," he says. "There are additional advantages to some of the new printer technologies that are coming out."

Boiling Ink

"Take thermal transfer, which is waxembedded ink on a ribbon. The printhead actually heats the ink up, boils it, and forces it onto the paper. The image you get on the paper is letter quality from a dot matrix printer," he adds. "And it's actually raised lettering. You can run your fingers across it, and feel the letters. So it provides a really, really high quality output."

Hafer's views are shared by International Resource Development, Inc. (IRD), a market research firm in Norwalk, Conn. Based on a study the company conducted, IRD predicts that dot matrix impact printers will soon lose the dominance they've enjoyed in the printer

marketplace.

"In 1983, impact matrix shipments accounted for 72 percent of all unit shipments; by 1993, the figure will be down to 20 percent," the study indicates. "It is not only under-\$500, fully formed character printers that will be responsible for the transformation of the microcomputer printer industry."

Low-Cost Contenders

The report predicts that by 1985 thermal transfer printers which use ordinary paper, operate quietly at high speeds, and produce color graphics and near-letter quality text will have 12 percent of the market. By 1993, the market share will be 28 percent.

"The major advantage of impact printers, besides multiple copies, has been the ability to work with ordinary paper rather than some specially coated paper that might be difficult to get, as is the case with thermal printing," says Ken Bosomworth, IRD president. "However, the two major low-cost contenders—thermal transfer and ink jet—also use plain paper. So they have no disadvantages vis-àvis the impact printer in terms of paper cost."

Thermal transfer printers do have a higher ribbon cost, he notes, since the ribbon

can be used only once.

From Clogged Tubes To Cartridges

Although ink jet printers have been manufactured for quite a while, recent technological advances have improved them too. Traditionally, ink jet printers have drawn ink into tubes then shot the ink at high speed onto the paper. When idle for a while, the tubes tended to clog. Ink jet systems also suffered from a reputation for being messy.

But Hewlett-Packard recently introduced a \$495 ink jet printer, named the ThinkJet, which uses low-cost disposable ink cartridges. And other companies are working on improved ink jet systems as well.

"We see ink jet printers as being a definite technological competitor," says Ron Ockander, director of sales for Epson. "You create a membrane of ink over a hole, then blast it onto the paper. The problem with filling a reservoir (in older ink jet models), is that it would clog eventually. This way, you don't fill a tube."

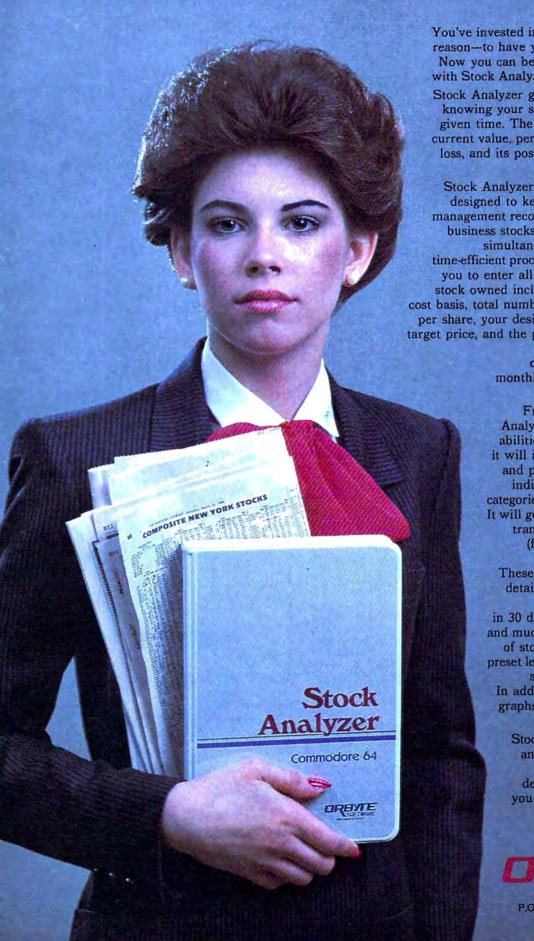

Laser Printing

On the horizon, but not yet inexpensive enough for the home, is the laser printer. It works something like a photocopying machine. Instead of using a light-reflecting mechanism to form patterns on a rotating cylindrical drum, however, the laser actually writes on the drum. Electrically charged particles form patterns on the drum where the computer has told the laser to draw.

But the least expensive laser printers cost about five or six thousand dollars. And the most expensive climb to the half-million

dollar mark.

Your Investment Advantage

You've invested in the stock market for one reason—to have your money work for you.

Now you can be sure it's doing just that... with Stock Analyzer from Orbyte Software.

Stock Analyzer gives you the advantage of knowing your stock's performance at any given time. The advantage of knowing its current value, percentage and dollar gain or loss, and its position as compared to your entire portfolio.

Stock Analyzer for the Commodore 64 is designed to keep accurate and complete management records of all your personal or business stocks, up to 250 with 25 active simultaneously. Through a simple, time-efficient process Stock Analyzer enables you to enter all vital information on each

stock owned including the company name, cost basis, total number of shares, average cost per share, your designated stop/loss level and target price, and the purchase date. Then enter price updates whenever

convenient—daily, weekly, monthly, etc.—and that's all you are required to do!

From this basic data, Stock Analyzer's powerful calculating abilities begin. At your request, it will instantly tabulate, display, and print statistical analyses of individual stocks, of specified categories, or of the entire portfolio. It will generate reports tracing the transactions of all stocks sold (for tax schedule D) and of additional shares bought. These reports provide you with details such as short/long term status, stocks going long in 30 days, % and \$ gain or loss, and much more. You'll be notified of stock prices not within your preset levels and sharply warned of stocks in a losing position. In addition, a variety of colorful graphs provide for even greater visual understanding.

> Stock Analyzer is the complete analytical program designed to assist your investment decisions. It's the advantage you need to get the maximum results from your money.

> > Availble at your local dealer.

THE INCOMPLETE WORKS OF INFOCOM, INC.

Incomplete, yes. But it's not just because we're always bringing out new stories in the Infocom interactive fiction collection. Nor is it simply due to the fact that with all the writing and re-writing, honing and perfecting that we put into every one of our stories, our work is seemingly never done.

The real reason is: an Infocom work of fiction can never be complete until you become a part of it.

You see, as hard as we work at perfecting our stories, we always leave out one essential element—the main character. And that's where you enter in.

Once you've got Infocom's interactive fiction in your computer, you experience something akin to waking up inside a novel. You find yourself at the center of an exciting plot that continually challenges you with surprising twists, unique characters (many of whom possess extraordinarily developed personalities), and original, logical, often hilarious puzzles. Communication is carried on in the same way as it is in a novel—in prose. And interaction is easy—you type in full English sentences.

But there is this key difference between our tales and conventional novels: Infocom's interactive fiction is active, not passive. The course of events is shaped by the actions you choose to take. And you enjoy enormous freedom in your choice of actions—you have hundreds, even thousands of alternatives at every step. In fact, an Infocom interactive story is roughly the length of a short novel in content, but because you're actively engaged in the plot, your adventure can last for weeks and months.

In other words, only you can complete the works of Infocom, Inc. Because they're stories that grow out of your imagination.

Find out what it's like to get inside a story. Get one from Infocom. Because with Infocom's interactive fiction, there's room for you on every disk.

INFOCOM

Infocom, Inc., 55 Wheeler Street, Cambridge, MA 02138

For your: Apple II, Atari, Commodore 64, CP/M8", DECmate, DEC Rainbow, DEC RT-II, 1BM PC" and PCjr, KAYPRO II, MS-DOS 2.0', NEC APC, NEC PC-8000, Osborne, Tandy 2000, TI Professional, TI 99/4A, TRS-80 Models I and III.

*Use the IBM PC version for your Compaq, and the MS-DOS 2.0 version for your Wang or Mindset.

"Even the most optimistic developers of laser printers don't see them coming down below a \$2000 selling price," says Bosomworth. "And in the home market, what people are really looking for is more like \$200.

"For that sort of price it's a contest between the ultra low-cost daisy wheel type like the one the Coleco Adam has—or various types of cheap dot matrix printers," he says.

But Micro D's Hafer has a more optimistic attitude about the future of laser printers. "I think the most promising area is laser technology. Canon, for instance, has a raster scan laser printer that will imprint the image onto the drum, and photoelectrically develop it using a chemical developer."

A Laser For The Macintosh?

"It probably won't be on the market until late '84 or '85, and it will retail for from three to five thousand dollars," Hafer says. "It's rumored that Apple will be using that technology for the Macintosh. I don't see how they can effectively use any other type of technology, the reason being that the laser

printer actually uses a video signal—a raster scan type of signal—to create the image on the drum. And the Macintosh is a completely video-based screen."

In addition to the Canon laser printer, it's reported that Ricoh of America, Inc., and Xerox are creating similar printers.

Despite the expectations for thermal transfer, ink jet, and laser printers, many industry observers are not ready to assign the dot matrix impact printer to oblivion.

"I'll tell you who will grab the market share," says Charles Srogus of Micro Peripherals, Inc. "It's going to be the (dot matrix) printers that are encroaching on the letter-quality printers. You're going to see an increase in the number of wires and the shape of the wires in the printhead.

"And the people who are going to be the leaders in this are those who have to use that kind of technology to print their language. The Japanese have had to work on this for some time," he says. "They have some very interesting products coming out that will also work in color."

Axiom's \$299 dot matrix printer with dot-addressable graphics is plug-compatible with the TI-99/4A.

Ringuette. "In other words, what software packages am I going to run, and what computer am I going to run this on?

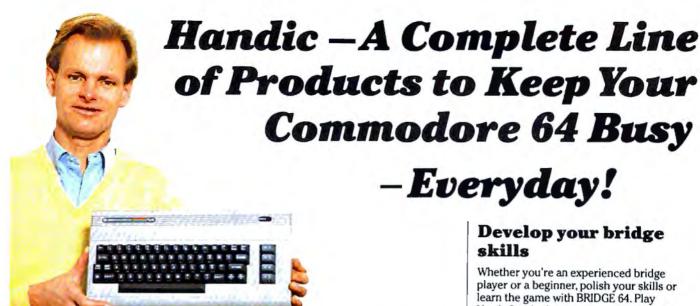

"Does the printer really work with that system? People get amazed by the compatibility problem. You get a printer, you hook it up, and it doesn't do anything because it's not compatible," he adds.

When buying a printer, make certain that the printer will work with your particular computer, or that there is an interface you can buy which will make the two compatible. Printer interfaces are usually Centronics parallel or RS-232-C serial types. If you're buying a printer from a store, have the dealer explain what interface you need to get the full capabilities of the printer for your computer.

Questions To Ask

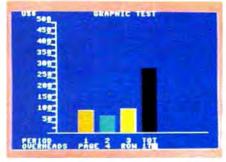

Before you buy your printer, you should also know the answers to the following questions:

The TTP16 is capable of printing bold face, double-strike, expanded, compressed, superscript, subscript, proportional spacing, underlining, Pica, Elite, and Italicized print as well as hex dumps and graphics.

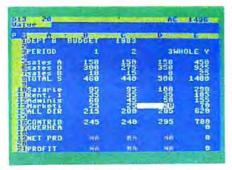

Handle your home budget, stock portfolio. loans and mortgages with Calc Result

Calc Result Easy is a simple-to-use spreadsheet program for the Commodore 64, it includes 254 lines × 64 columns, built-in graphics, and flexible printout formats. Plug-in cartridge... just plug it in and its ready. Perfect for cash flow analysis, personal net worth, IRA analysis, travel expenses. credit card expenditures, gas and electricity bills, etc.

Calc Result Easy \$49.95

Calc Result Advanced gives you 32 pages of interrelated information. The three-dimensional feature allows you to consolidate calculations in summary format. Calc Result Advanced comes on plug-in cartridge and disk. Disk drive required.

Bundling Printers With Computers: Did Coleco Answer A Need?

Selby Bateman, Features Editor

Coleco made headlines late last year when it introduced the new Adam computer system, complete with a letter-quality daisy wheel

printer, all for under \$700.

Since that time, industry leaders and observers have waited and watched to see if Coleco's bundling was a brilliant idea whose time had come or merely a gimmick that would fail to catch on. The results, according to a number of industry leaders, have been a little bit of both.

"There's a definite trend toward bundling," says Craig Ringuette, merchandising manager for Okidata, a leading printer manufacturer. He admits, however, that he

is dissatisfied with Coleco's effort.

"The Coleco printer is a 12 cps (characters per second) daisy wheel. You can almost type as fast as that. You can't print graphics. That thing has so many limitations, I don't know how anybody could be satisfied with it for any type of real computer application. You'd be spending your whole life waiting for the printer to get caught up."

Consumers Like Bundles

Despite Ringuette's assessment of the Coleco printer, he's convinced that bundling is attractive to most buyers of personal computers. "Say I'm Joe Consumer. I buy an Apple computer, and if there's an Apple printer sitting there, it's going to be a lot easier to sell me that than it is an Okidata or an Epson or anybody else.

"It may not be the wisest move you can make, but you're seeing a trend toward it,"

he says.

Opinions differ on the success of bundling, however. "I have not seen that to be a trend," says Rick Osgood, national technical support manager for Star Micronics. "It's something a marketing group will try, to see what the reaction is; and based on the reaction, decide to go whole hog or not. But across the industry, I have not seen that to be a large idea that has taken hold."

A Question Of Profits

"From a marketing standpoint, your periph-

erals are your bread and butter. You can undercut (the retail pricing) on your main system—your CPU (central processing unit). You're not as likely to bundle your add-ons: printers, modems, disk drives," Osgood says.

While some manufacturers have tried bundling in one form or another, it can create problems for dealers who sell to the public, says Ron Ockander, director of sales for Epson America, Inc. "We did a bundle last July. You could walk away with a printer and a computer, for the price of the computer. And Apple is doing it now with its Image-Writer [the printer that is a part of the Macintosh system]," he says.

"But we have to be very careful that we don't alienate the dealer. If he wants to sell a different type of bundle, he likes to have that prerogative. And if you take that away from him by forcing him to buy in bundles, it takes away some of his merchandising capability,"

Ockander says.

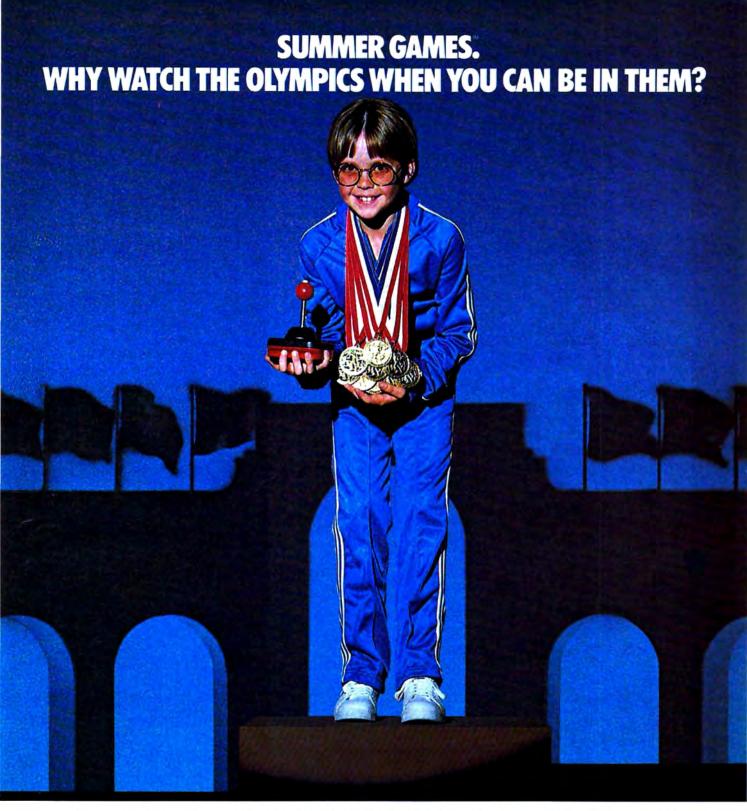

Experience Is A Factor

For many first-time computer users, a bundled system is as attractive for a computer as it is for a stereo system, notes Jim Hafer, supervisor of product evaluations for Micro D. "It's going to have its place. There are certainly people who are going to want to buy a bundled package. But the people who are really dedicated to using computers, and getting the most out of them, will buy their original accessories separately."

Market researcher Ken Bosomworth believes that bundling will be attractive to consumers in the future. "Particularly as the home user gets more into using his computer to do teleshopping and electronic banking and so forth, he's really going to want a running paper record of transactions that

he's initiated.

"And I think you'll find that computer manufacturers are going to respond to this by both bundling and building in printers in many future home computers," he says. "But they will not necessarily be full 80-column printers. They may be little calculator-type strip printers."

You're an Olympic athlete competing in eight key events at the Summer Games. How well can you score in track, swimming, diving, shooting, gymnastics and more? So realistic, there's even an opening ceremony and awards presentation after each event.

Unlike other "Olympics-Like" games, Summer Games has incredible realism, superb state-of-the-art graphics and sound effects (including national anthems from 18 countries), and it is a true action-strategy game. In each event you must plan and execute your game strategy in order to maximize your score. It is not just a matter of how fast you can move the joystick.

So change into your running shoes, grab your joystick and GO FOR THE GOLD!

One or more players; joystick controlled.

Strategy Games for the Action-Game Player

The Inexpensive Printers Of 1984

Kathy Yakal, Editorial Assistant

Perhaps more than any other peripheral even computers themselves—printers have made tremendous advances over the last year. Higher-quality print technology that could only be found on over-\$1000 models can now be had for less than \$700.

The following chart lists features of these inexpensive peripherals. We have tried to be as comprehensive as possible. If any manufacturer has been left out, we regret the

omission.

Here's a brief explanation of printer specifications:

Compatibility: Perhaps the biggest stumbling block in matching a printer to your needs. Many printers will accept both parallel (Centronics) and serial (RS-232 or IEEE-488) interfaces; some even have cables for specific computers. Be sure the printer you want has the correct interface, and that you have any necessary cables or connectors.

Print Technology: The method employed to print characters on paper. In the under-\$700 category, there are several: impact (dot-matrix or daisy wheel); thermal, which requires special paper; thermal transfer, which works with any kind of paper; and ink-jet, which sprays the ink on the paper through tiny holes. (For more detailed description, see Selby Bateman's article "Choosing The Right Printer" elsewhere in this issue.)

Speed: How fast the printer prints, usually noted in characters per second (cps).

Pitch: Characters per inch (cpi) or characters per line (cpl). This can vary, if the printer supports software that calls for different fonts, like italics, double-width, or compressed characters.

Logic-Seeking?: To print as quickly as possible, many printheads will move in the most economical direction, bidirectionally, and "look for" the closest character at the end of each line.

Buffer: This is another way many printers save you time. A buffer is that area of a printer that "holds" the characters next in line to be printed, freeing up the computer for further input. Most printers have very small buffers, but buffer expansion cards are available for longer printing jobs.

True Descenders?: On some printers, lower-case letters that have "tails," like j, g, and y, do not extend below the line. If you're using your printer for anything beyond casual home use, you will probably want a printer that can print true descenders.

Paper: Maximum width paper you can use with this printer. Standard printer paper for use with tractor feed printers is 9.5 inches wide. With a friction feed printer, any size paper, up to the maximum regulated by the carriage width, can be used.

Feed Type: Pin (tractor) and friction feed are the two most common found on printers for personal computers. Sprockets on the edge of the printer's platen catch the holes at the edge of the paper on tractor feed printers. Friction feed is similar to the way a typewriter holds the paper. Some printers have the option for both; if not, manufacturers often offer optional snap-on tractors.

Suggested Retail Price: List price at the time this chart was prepared. Individual retailers' prices may vary.

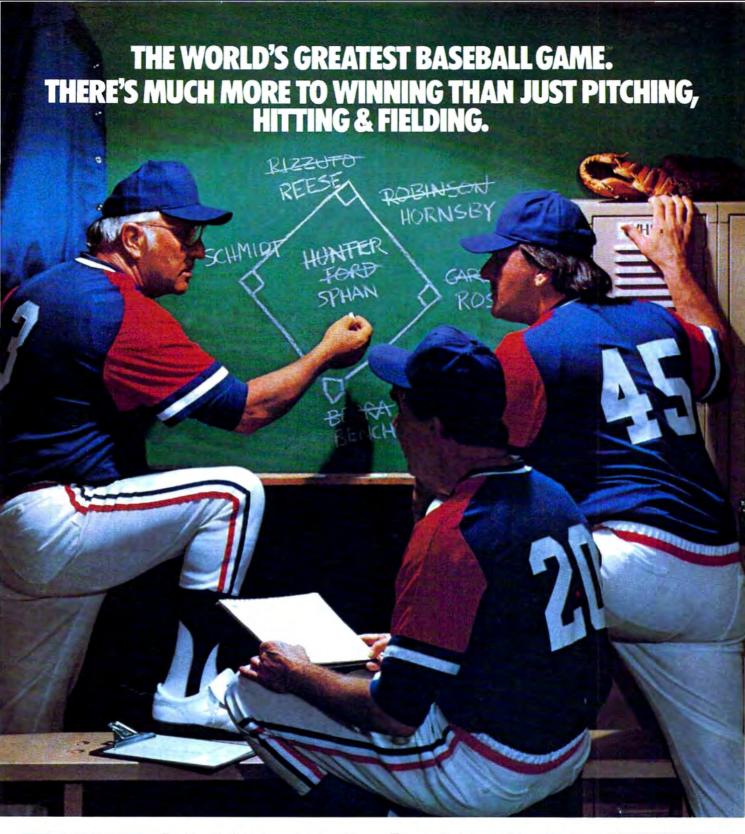

Most printers are capable of printing graphics, as well as additional character sets beyond the standard 96-character ASCII set.

• What print width do you want? The number of characters that a printer can put on a line varies from 32 to 40 to 80, and even up to 132. The 80-column format is a standard with $8\frac{1}{2} \times 11$ -inch paper for word processing, and is thus one of the most popular widths.

• Do you want to print graphics, or only text? Many dot matrix printers allow you to print an almost unlimited variety of graphic images. Daisy wheel printers, however, use preset, fully formed

characters. In addition, there are printers which support high-resolution images from your screen.

There is evidence that personal computer users are becoming more interested in these graphics capabilities as the price of printers comes down. "That's because of the business market," says Micro Peripherals' Charles Srogus. "But people in the home have seen that. The consumer is looking at it and saying, 'Gee, this is fun. I'd like to do that myself."

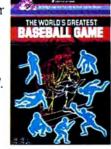

Real baseball is more than just hitting, pitching and fielding. It's also your favorite major league teams, the great stars of today and the Allstars of yesteryear. It's statistics and coaching, and it's managing your own game strategy. With the World's Greatest Baseball Game, you have it all. Pick your major league line-up using the actual player and team stats. Then watch the action unfold against an opponent or the computer.

Two modes let you choose between managing and controlling your team or managing only. The World's Greatest Baseball Game—everything you could ever want except the hot dogs and peanuts.

One or two players; joystick controlled.

Get more out of your Commodore with

COMPUTE'S © ANDERSTREET

For Owners And Users Of Commodore VIC-20" And 64" Personal Computers

More fun

Martian Prisoner, The Viper, Skydiver, Snake Escape, Demon Star, Cyclon Zap and Oil Tycoon are just a few of the ready-to-run games you'll find exclusively in COMPUTEI's Gazette each month. Just type in the programs and watch your screen explode with colorful new computer game excitement.

More challenge

Ready to tackle more advanced projects? In COMPUTEI's Gazette you'll learn How to Use Tape and Disk Files. How to Program the Function Keys. Writing Transportable Basic. How to Make Custom Graphics Characters. New Ways to Enliven Programs with Sound. One Touch Commands for the 64. How to use Machine Language. Speeding up the VIC 20—and much more!

Children will learn and develop new skills with States & Capitals Tutor, Wordmatch, Munchmath, Wordspell, Connect the Dots, Aardvark Attack and Alfabug. *Computing for Kids*, a regular monthly feature, will uncover new ways to involve your children in computing.

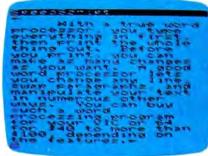

More programs

Programs to help you balance your checkbook, store your addresses, keep tax records, manage your personal business. You can create your own programs and games, improve your word-processing, spreadsheets and data base management, load and run faster with 64 Searcher, VIC/64 Program Lifesaver, Quickfind, Word Hunt, Disk Menu, VIC Timepiece, Automatic Proofreader

More buying guidance

You'll profit from comprehensive reviews of everything from data-quality cassette tapes to software to graphics plotters and modems. Virtually anything that's compatible with your Commodore is reported on in COMPUTEI's Gazette. With this kind of expert help, every computer purchase you make can be the right one!

More savings

You can save up to 40% off the newsstand price of *COMPUTE!'s Gazette* by subscribing now. All you do is mail the coupon below or the postpaid card bound into this issue. But don't delay! Subscribe now to start receiving every issue of *COMPUTE!'s Gazette*.

Introducing
The Switch Hitter

The computer compatible electronic typewriter from Swintec.

Now there's a full-featured intelligent typewriter that can do double office duty as a letter quality computer printer . . . with just the simple flick of a key switch!

The 1146CMP electronic typewriter from SWINTEC has built-in interface capabilities which allow it to function with virtually any computer. The computer compatible capability of the 1146CMP makes it possible for your computer to perform word processing and print-out functions easily.

As a typewriter, the 1146CMP has all the electronic

features needed for efficient typing: 46 characters of correction memory, a relocation key for quick positioning after correcting, automatic paper feed, both forward and reverse indexing, and repeat capability on all keys.

I want to know more about the SWINTEC 1146CMP	
☐ Send me more information	
☐ Have a SWINTEC dealer contact me

No special training is required to perform either typing or word processing operations. And the 1146 CMP is available, complete with computer interface, for under \$600.*

Best of all, the 1146CMP is extremely easy to use.

The computer is basic to the fully automated office; SWINTEC computer compatible typewriters bring office integration one step nearer.

Switch to SWINTEC. . . and get our Switch Hitter

on your team.

*Also available as 1146CM, without interface, at an even lower price

Many More Options

- What special print capabilities do you need for text? Many printers today give you the option of printing elongated type, condensed characters, underlined text, subscripts and superscripts, boldface and italic type, and other special forms. Some printers will also let you print different typefaces in a variety of sizes.
- What kind of paper do you want with your printer? There are tractor-feed printers which precisely advance paper by using teeth that fit into holes on both sides of the paper. The teeth pull the paper through the printer in one continuous feed. But the paper can later be separated into standard sheets. Friction-feed printers operate much like a typewriter, pulling the paper around a cylindrical platen. Friction-fed paper can slip out of alignment more easily than tractorfed, however.

The Thinklet Printer by Hewlett-Packard (HP 2225) is a \$495 ink jet printer which uses an ink cartridge system and is fully portable.

 How much noise can you tolerate? Daisy wheel and dot matrix impact printers can produce quite a bit of noise, something you might also need to consider.

Once you've answered all of these questions, then you're ready to shop around and find the printer that does the best job for your computer.

A printer is so important for most computer users that Okidata's Ringuette sometimes gets the feeling that the purchase of a computer and then a printer is putting the cart before the horse. "You really ought to buy the printer first. Most people buy the thing backwards," he says, not quite tongue in cheek. "Basically, a computer is only worth the paper it's printed on."

If you want to stay ahead of the personal computing revolution...

... welcome to COMPUTE!'s PC & PCjr!

This exciting new magazine from <u>COMPUTE!</u> takes you inside the PC and the incredible new PCjr to bring you inside information you'll find nowhere else.

You'll discover how to get the most computer power for your money. At home. At school. At work. With easy-

to-run programs. Challenging projects for advanced users. Brand new sound and graphics applications. Plus some of the most exciting computer functions outside of the top-secret research labs!

We'll help you decide what to buy. With independent evaluations of hardware, software and peripherals. Comprehensive reviews of new products as they're introduced. Hard-nosed evaluations of each machine's strengths and weaknesses.

COMPUTEI'S PC & PCjr will keep you on the leading edge of personal computing like no other publication can. Here are some of the features you can look forward to:

Welcome to the PCjr! A complete introduction to IBM's newest personal computer, and a fascinating peek at the 8088 microprocessor — the tiny-but-talented brain of the PCjr.

Designing PCjr — The Inside Story. PCjr's creators tell how they designed the new computer – from original planning to trade-offs to ultimate success.

Telecomputing with Your IBM. How to link up with distant computers over ordinary phone lines, access information services, even do office work at home with your own machine!

Music and Graphics. How to play songs and create sound effects with your PC or PCjr. Programs to generate impressive hi-res graphics and computer animation.

Your First Hour with an IBM. How to avoid those opening night jitters and get your computer up and running fast!

Financial Analysis. Ready-torun programs to help you make intelligent investments.

PC vs. PCjr. Which one is right for you? <u>COMPUTE!'s PC & PCjr</u> helps you decide!

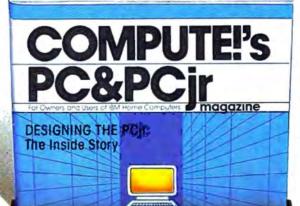

PLUS: Programming the function keys to suit you. Speeding up BASIC without resorting to machine language. Tape, disk, or hard disk? Buyer's guides. How to take advantage of free public-domain software. Computing activities for the whole family. Reviews. Games. Educational programs for children. And much, much more!

Subscribe right now and you can enjoy special Charter Subscriber Savings on <u>COM-PUTE!'s PC & PCjr</u> – just \$24 for the first 12 big issues. That's 33% off the cover price!

Avoiding Printer Problems

J. Blake Lambert, Assistant Editor

When you first bring your new printer home—before you connect it to anythingyou should read through the manual. And if you have an add-on interface, read its manual, too. If you just pull everything out, try holes till the plugs fit (or bend), plug everything in and say, "I command thee: PRINT," it probably won't work. You may get a few things to work this way, but you're likely to run into problems.

Don't Force Connections

After looking through the manual, follow the recommendations for connecting the printer to the interface (if necessary) and computer. Don't force connections together. The connections should be snug, but if the parts don't fit, check the diagrams and text to make sure you are doing everything right.

You may need to install the print ribbon, and check the print head (or insert a daisy wheel, on letter-quality printers). Check the manual for instructions, and check on the printer for stickers with diagrams and instructions that may have been left out of the manual.

Before you turn the system on, check the printer manual to see the correct setting for the DIP (Dual In-line Package) switches.

These allow you to select the functions that the printer will default to—the normal settings. Some interfaces also have internal DIP switches which you need to set to get the best results. See the interface manual to find the correct switch positions for your system.

Sometimes just feeding the paper through the printer causes problems. Most of these are easily cured. When using continuous pin-feed paper, make sure the paper is not in a bind anywhere on its way to the printer. If your printer allows for both regular and pin-feed paper, be sure the platen is set for the correct mode. If the platen is holding the paper while the tractor mechanism is trying to pull the paper through, this can cause the paper to jam.

The first time you print something, don't be shocked if the printer puts everything on one line, or if you get double-spacing when you expected single. This is usually not a problem with the printer. Instead, it can mean that the DIP switches are still not set correctly, or that you are using the incorrect interface mode. Experiment with the interface modes; you can't hurt anything, and you may discover some features you didn't know about.

THERE'S A COMPUTER BORN EVERY MINUTE... GIVE IT A HOM

For \$89.95 with the CS-1632 you can house your computer, peripherals, and accessories without spending a fortune

For those with a large computer family the CS-2748 gives you all the room you need for your computer, monitor, printer, peripherals, software, etc. at a price that's hard to believe: \$299.95.

The CS-1632 computer storage cabinets compact yet functional design fits almost anywhere while housing your computer monitor, joysticks, software, books and peripherals all for only \$89.95

The slide out shelf puts the computer at the right height and position for easy comfortable operation.

The fold up locking door keeps unwanted fingers off the key board when not in use To store joysticks just turn them

upside down and slide them into the inverted storage rack.

Twist tabs on the back of center panel allow for neat concealed grouping of wires, while power packs rest hidden behind center panel on shelf.

The slide out software tray

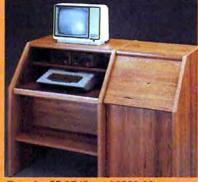

has room for 14 cartridges or cassettes and up to 30 diskettes. Most brands of software will fit between the adjustable partitions with a convenient hook for the spare key at rear. Stand fits Atan 400 & 800, Commodore 64 & VIC 20.

Ti 99/4A and TRS-80. Cabinet dimensions overall 36" high x 33-7/8" wide x 16" deep.

Prices subject to change. Shipment subject to availability

Both the CS-1632 and CS-2748 ship unassembled in two cartons. Assembly requires only a screwdriver, hammer, and a few minutes of your time. Choice in simulated woodgrain of warm golden oak or nch natural walnut finish.

The two slide-out shelves put the keyboard at the proper oper-ating height while allowing easy access to the disk drives. The bronze tempered glass door

protecting the keyboard and disk drives simply lifts up and slides back out of the way during

Twist tabs on the back of the center panel allow for neat concealed grouping of wires while a convenient storage shelf for books or other items lies below. The printer sits behind a fold down door that provides a work surface for papers or books while using the keyboard. The lift up top allows easy access to the top and rear of the printer. A slot in the printer shelf allows for center as well as rear feed printers.

Behind the lower door are a top shelf for paper, feeding the printer, and a bottom shelf to receive printer copy as well as additional storage. Stand fits same computers

as the CS-1632 as well as the Apple I and II, IBM-PC, Franklin and many others.

The cabinet dimensions overall: 39-1/2" high x 49" wide x 27" deep.

Keyboard shelf 20" deep x 26" wide. Disk drive shelf 15-34" deep x 26" wide. Top shelf for monitor 17" deep x 27" wide. Printer shelf 22" deep x 19" wide.

Poor Joe. Weeds and blight are choking and wilting his flowers. Use a joystick to help him save his blossoms from oblivion. Originally written for the Commodore 64, versions are included for VIC-20, IBM PC, and PCjr.

Ever since man cleared his first plot of ground and planted a few seeds, he has fought an endless battle with the enemies of his garden, the dreaded weeds. Now, you can join the agrarian struggle, and you won't even have to get your hands dirty.

Using a joystick plugged into port 2, you can guide Joe the gardener as he races around, spraying weeds where they appear and fumigating his flowers against another deadly enemy, disease. Joe not only has weeds and disease to contend with, but he also must keep track of time. If he spends too much time killing weeds and spraying flowers, the timer will run down and disease will overrun his garden.

If Joe manages to overcome all these obstacles, he will advance to the next level of difficulty where more flowers and nastier weeds await him. When Joe completes a level, the amount of time remaining on the clock is awarded to him in the form of bonus points.

A Two-Minute Flower Show

At the beginning of each game, Joe has two minutes to complete the level, but with each successive level he gets 15 extra seconds to finish his work. There are three kinds of flowers in Joe's garden—yellow daisies, blue daisies, and red roses. They all must be fumigated to complete a level, but Joe doesn't have to kill all the weeds on a level.

All it takes to fumigate a flower is to position Joe's spray gun so that it points to a flower, then press the joystick button. Flowers which have been fumigated turn white. The process is the same for weeds, but Joe's spray is a deadly poison to weeds, bringing instant disintegration.

Joe gets 10 points for fumigating yellow daisies, 20 points for blue daisies, and 40 points for roses. Killed weeds are worth five points.

The Life Cycle Of Weeds

Weeds grow in three stages. They start off as seeds, grow to sprouts, and then become adults. In the adult stage, they multiply rapidly by spreading seeds which grow to adulthood and then repeat the process. If too many weeds are allowed to grow in the garden, the game ends and a TOO MANY WEEDS message appears on the screen.

Likewise, if time runs out, the game will end and a TIME'S UP message will appear.

The highest score will be kept and displayed by the computer between games. Playing "Pests" takes a quick mind and a fast trigger finger, so if you've ever wondered if you have a green thumb, here is your chance to find out.

XXON FOR THE C-64! The Official

Sentinel

You're at the controls of a heavily armed starship, maneuvering through deadly asteroid belts and intergalactic minefields. It's up to you to destroy wave after wave of enemy ships as the

incredible 3-D action never stops. Commodore 64 disk & cassette

ZAXXON"

At last, your favorite arcade game comes home to the C-64! Amazing 3-D graphics, a diagonally scrolling screen and incredible sound effects guarantee hours of space excitement. And if you practice hard, you might be able to

meet the deadly ZAXXON himself.

Commodore 64 disk & cassette

ZAXXON is a trademark of SEGA Enterprises, Inc.

Slamball

Maybe you've played pinball before, but not like this! Up and down scrolling over 4 full screens, plus complete ball control and even a "tilt"

feature in the best computer pinball game yet. Commodore 64 disk & cassette

All Synapse entertainment titles are available at software dealers everywhere, or direct from Synapse for \$34.95 (\$39.95 for ZAXXON) plus \$2 handling. Send check, money order or VISA/MasterCard number.

More C-64 Titles:

Blue Max, Fort Apocalypse, Shamus and Shamus Case II, Necromancer, Pharaoh's Curse, Zeppelin, Drelbs, Quasimodo.

ENTER: THE BRADY ADVENTURE

If you're bored with the ordinary, dreary functions you've been performing day-by-day and even games have lost their luster, Brady brings back the adventure! You and your Commodore 64 can enter a whole new colorful world of excitement—if you're in command.

Brady Communications, Inc., puts you in control of the fun with a complete line of amazingly easy-toread books, published especially for you and your Commodore 64. Whether you're a beginner, an advanced user, a whiz kid, a parent, a teacher or a hacker, Brady publishes the books to teach you how to make the most of your computer. From BASIC to games, from graphics to sound, from software to debugging, these books will let you key into your imagination in microtime and bring it up on screen. Enter The Brady Adventure—the excitement is all yours.

BOREDOM

BLAST OFF WITH BASIC GAMES FOR YOUR COMMODORE 64 David Busch

This is the first really fun approach to BASIC ever devised. The book containing time-tested, highly visual games makes it easy to learn BASIC programming on the Commodore 64 computer. It includes 25 games that take advantage of the Commodore's special features including graphics, sound and jovsticks. The programs are even suitable for customizing for further fun. 1984/128pp/paper/ISBN 0-89303-333-2/\$12.95

BLAST OFF WITH BASIC GAMES FOR YOUR VIC 20 David Busch

Twenty-five games make it simple to learn BASIC for your Vic 20. With twenty-five, time-tested, highly visual games, this book lets you take full advantage of the fun available on your Vic 20.

1984/128/paper 0-89303-334-0/\$12.95

COMMODORE 64: AN INTRODUCTION TO BASIC PROGRAMMING AND APPLICATIONS

Larry Joel Goldstein & Fred Mosher

In this volume the master teacher has taken a hands-on approach to BASIC language and practical real-life applications. The book gives a complete and up-to-date account of what the Commodore 64 is and how it works. Page by page, the reader is introduced to DOS and BASIC. It shows how to program for personal and professional needs and includes programs for mailing lists, word processing, telephone lists, graphics, sound, and file handling—plus extensive coverage on structuring, planning, and debugging programs. 1984/288pp/paper/ISBN 0-89303-381-2/\$14.95

ADVANCED BASIC PROGRAMMING FOR THE COMMODORE 64 AND OTHER COMMODORE COMPUTERS

Michael Richter

This is the next step for the Commodore user who has mastered the basics and wants to move on to more advanced software. In this book, the reader will learn how good programs are written, how to read and use them, how to know a good one when they see it, and how to gain knowledge through the experience of writing advanced software. 1984/204pp/paper/ISBN 0-89303-302-2/\$14.95

COMMODORE 64: GETTING THE MOST FROM IT

Tim Onosko

Written for users with little or no previous programming experience. this handy guide is the only source with information on all three versions of the Commodore 64. It includes material on both the classroom model and the portable version. It offers a thorough and understandable introduction to the computer-including a solid approach to BASIC programming. It covers word processing, color graphics, and sound. 1983/320pp/paper/ISBN 0-89303-380-4/\$14.95

BRAIN GAMES FOR KIDS AND ADULTS USING THE **COMMODORE 64**

John Stephenson

Between the front and back covers, this volume contains more than 40 exciting and challenging games. Designed to entertain and educate the reader, it teaches programming and the application of some very important mathematical concepts. without the pain. The games are short and precise and are targeted toward whose who learn best by doing. They can be played and enjoyed without an understanding of the mathematics involved. This is one volume you'll want to have for fun-for kids of

1984/160pp/paper/ISBN 0-89303-349-9/\$12.95

BRAIN GAMES FOR KIDS AND ADULTS USING THE VIC 20

John Stephenson

This is the volume especially for your Vic 20. Containing more than 40 challenging games, the book teaches programming and some basic mathematical concepts simply in the doing. Be sure and have this book to make your Vic 20 more fun.

1984/160pp/paper/ISBN 0-89303-347-2/\$12.95

HANDBOOK OF BASIC FOR THE COMMODORE 64

Fred Mosher & David Schneider

For the beginner, here is the book to buy with your Commodore 64. It is simply organized by BASIC programming statements so while programming, the user can go directly to the information he needs without confusion or delay. This one-of-a-kind guide contains the same information as the BASIC reference manual supplied with your Commodore, rewritten especially for the new user. It presumes no knowledge of BASIC and explains the materials supplied in the manual.

1984/256pp/paper/ISBN 0-89303-505-X/\$14.95

These and other Brady Books written specifically for your Commodore 64 and Vic 20 are available at B. Dalton Booksellers, Walden Books. and other fine bookstores and computer dealers nationwide. Or, call 800-638-0220 for information. Brady Communications, Inc. is a Prentice-Hall Company, located in Bowie, Maryland 20715.

In this 64 version of "Pests," the player tries to fertilize the flowers.

If you want to save yourself the trouble of typing the Commodore 64 version of this program, send a stamped, self-addressed envelope, a blank cassette or diskette (1541 format), and \$3 to the address listed below, and I will make a copy (64 version only) for you.

SOFTWARE ARTISTS?

TO MAKE THE FIRST BASKET-BALL PROGRAM that feels like the real thing, it helps to start with two guys who know what the real thing feels like.

Enter Larry Bird and Julius Erving. Bird — the hustler, the strong man, deadly from outside. Erving — The Doctor, maybe the most explosive player in the history of the game.

We talked to them, photographed them in action, studied their moves and their stats and their styles. Then we set out to create on computer disc an event which may never happen in real life. We put the two of them together on a dream court of light, for an electronic afternoon of one-on-one.

It wasn't easy. When they talked, we listened. When they criticized, we made big changes. When they gave suggestions, we took them.

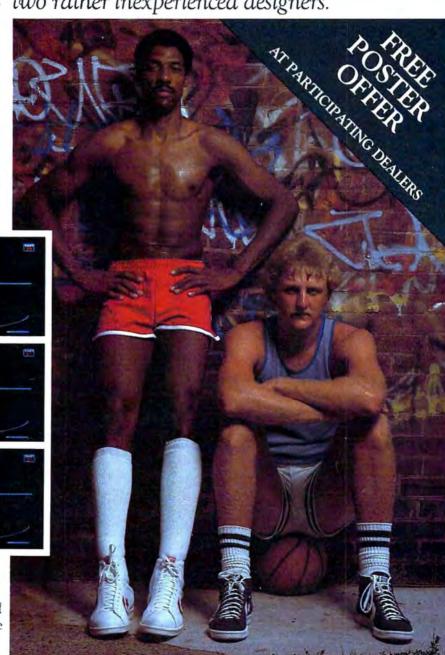

And it shows. This thing is absolutely uncanny. You actually take on all the skills and characteristics of Bird or The Doctor — their own particular moves, shooting abilities, even strength and speed.

You'll meet with fatigue factors, hot and cold streaks, turnaround jump shots, and 360-degree slam

dunks. But there's some whimsy in here, too—a funny referee, a shattering backboard, even instant replay.

It's called Julius Erving and Larry Bird Go One-on-One." You're Bird. Or you're The Doctor. And that's the last decision you'll have plenty of time to make.

How we got this year's hottest sports game out of two rather inexperienced designers.

Julius Erving and Larry Bird Go One·on·One is now available on diskette for Apple II, II+, and IIe computers. Apple is a registered trademark of Apple Computer. To find out more about Electronic Arts and its products, write us at 2755 Campus Drive, San Mateo, CA 94403 or call (415) 571-7171. For a free catalog, send a stamped, self-addressed #10 envelope. Also available for the Commodore 64. Coming soon on IBM and Atari home computers.

Notes For VIC, PC, And PCjr

Kevin Martin, Editorial Programmer

In "Pests," you are the gardener and you must protect the flowers from deadly weeds and disease. Protect the flowers from disease by fumigating them with a special spray. When you spray the flowers, you receive points—10 for yellow flowers, 20 for blue, 40 for red—and the flowers turn white. Destroy the weeds which grow in the garden by spraying them with the same sprayer. If you allow too many weeds to grow in the garden or your time runs out, the game ends. If you finish before the time runs out, you receive bonus points for the extra time.

The VIC version of Pests requires an 8K expander and a joystick. To RUN, first type in the program and save it to tape or disk. Then, turn the computer off and back on to reset the BASIC pointers. Next, enter the following POKEs to move screen memory

and the top of BASIC:

POKE 43,1:POKE 44,32:POKE 8192,0:NEW POKE 36869,240:POKE 36866,150:POKE 648,30: PRINT"{CLR}"

The screen should momentarily display a flash of garbage before clearing. You now can load the program and run it as you nor-

mally would.

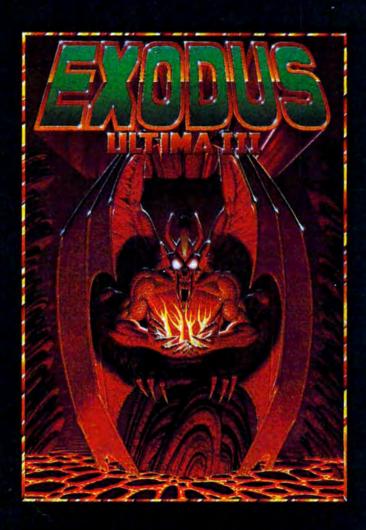

The PC version requires disk BASIC and the Color/Graphics Adapter board. This version will also run on a PCjr with Cartridge BASIC and disk. On the PC, you control your gardener (represented by a smiling face character) with the numeric keypad. On the PCjr, use the arrow keys at the right of the keyboard to control the gardener.

"A LIVING TAPESTRY . . ."

"The world of Ultima III can only be compared to a living tapestry — complex and beautiful . . . This is the best fantasy game in computing. Indeed, it is one of the best fantasy worlds in which to live. Lord British is a veritable JRR Tolkien of the keyboard." — Popular Mechanics

"Exodus: Ultima III, with a superior plot to match its superior gaming system, is a great game. It upgrades the market; in several ways it sets new standards for fantasy gaming state of the art." — Softline

"Exodus: Ultima III is Lord British's magnum opus — so far. It's fun and exciting to play and constantly intriguing. And the ending is marvelously unexpected and not a bit disappointing — except that it is the ending, and as with a good book, you'll probably wish there were more." — Softalk

46 COMPUTE! June 1984

BRUTAL! RUTHLESS! UNPREDICTABLE!

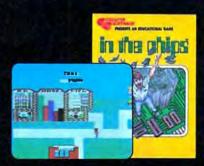

IN THIS GAME, YOU REALLY GET THE BUSINESS.

ing round the clock coming up with new products, the warehouse is overflowing, the advertising agency wants more money, your customers are fickle, and the competition just slashed their prices. We're all waiting for your decision.

Put yourself at the helm of this enterprising new software company.

Okay, boss, now what do we do? Research & Development is work-

Put yourself at the helm of this enterprising new software company. Every major decision is in your hands. Use your logic and intuition to spot market trends. Keep a close eye in your balance sheet. Get a grip on your company, a leg up on your competition, and a strangle-hold on the market. Do you have what it takes to be King of Silicon Valley? Or will you end up selling apples on skid row?

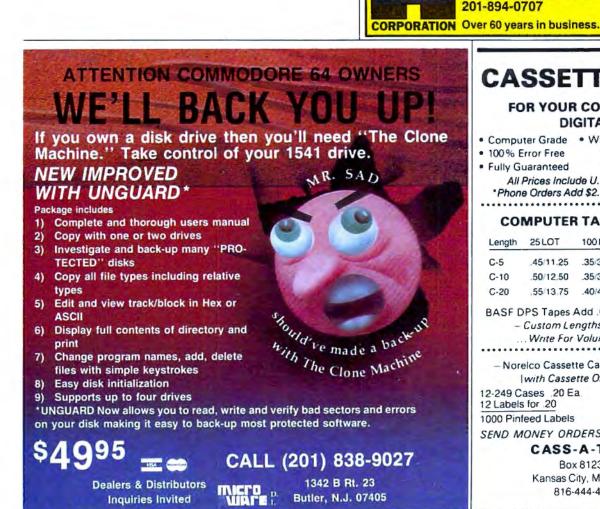

Intense strategic challenge combined with a real education in the workings of big business make In The Chips one game anyone can profit from.

IN THE CHIPS.™ Concept Education for the VIC-20, Commodore 64, IBM PC and PCjr.

The HarDrive™ by QuCe5. More bytes for your buck. In a flash.

If you're looking for a way to get more performance out of your microcomputer, look no further than QuCe5.

With a QuCeS HarDrive subsystem, you can make your micro behave almost like a mainframe. 10 to 114 megabytes of mass storage lets you handle data bases that would make the normal micro blow a fuse. And you can access, update and process data so incredibly fast, you won't believe your eyes. A QuCe5 HarDrive with an optional 5 megabyte backup cartridge, also means you 220

won't have to rely on a very unreliable storage medium for your crucial data—namely floppy disks-ever again.

Another QuCe5 plus is compatibility. It interfaces with most popular microcomputers like IBM, Radio Shack, Apple, DEC, Epsonyou name it. Installation couldn't be easier, our software is easy to use, and each HarDrive is backed by a 1-year warranty.

For complete details, contact

Olympiad

Kevin Woram and Mike Buhidar, Jr.

In this mythical struggle between a magician and a king, you decide the fate of the realm with your joystick. Written for the 64, we've included versions for the VIC and Atari.

Long ago Admar, a magician of great power, served the king of Denbar as an advisor in matters of war. Through the years Admar's power grew so much that the king began to fear him. Foolishly, the king decided that because of his power, Admar could no longer be trusted, and he plotted to kill the magician.

Admar, however, was still loyal to the king, and when he learned of the king's plot he decided to flee the kingdom with a legion of his own loyal warriors.

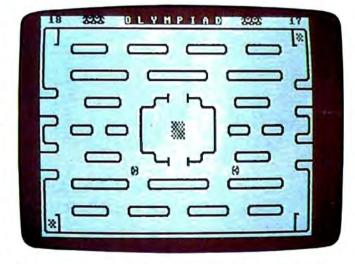

The king followed with his army and attacked Admar's stronghold, resulting in heavy casualties on both sides. Both the king and Admar now realized that warfare would be very costly in lives.

An Enchanted Arena

So it was agreed that an enchanted arena should be built where the king's Black Knights would do mock battle with Admar's Red Knights.

You and a friend control the actions of the knights as they fight for their masters. Movement in all eight directions is controlled by the joystick. The red knight is controlled by the joystick in control port 1, the black knight by the joystick in port 2.

The knights have also been given 20 magical arrows which stun on contact. The arrows are launched by pressing the fire button. When a

Players get ready to challenge each other ("Olympiad," 64 version).

fighter has used all of his arrows, his only defense is to run.

Teleportation Grids

To add an element of randomness to the battle, three enchanted teleportation grids have been added to the arena. When any warrior steps onto one of these grids, he is instantly teleported to a random position in the arena.

If you want to save yourself the trouble of typing in this program (64 version only), just send a blank cassette or diskette (1541 format), a self-addressed, stamped mailer, and \$3 to either address listed below. Please specify that you wish a copy of the "Olympiad" program.

Share the Olympic Experience. "Standing on the top of the Olympic victory stand is like stretching one's body on the top of the world. It is a moment where the individual man or woman gets introduced to the whole planet. It is a moment that is his or hers alone."

—Olga Connolly Gold Medalist, 1956 Olympics

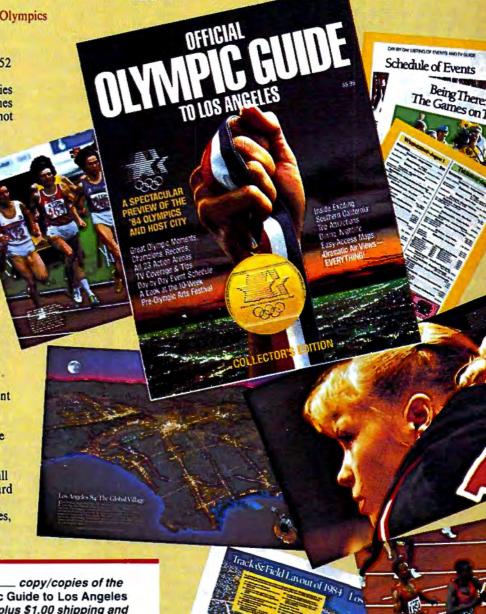

his summer, the Olympic torch will return to Los Angeles after 52 years. The stage is set. Some 10,000 athletes from 150 countries will battle for the gold in the historic Games of the XXIII Olympiad. And whether or not you plan to attend the Games, you can participate in the drama of this oncein-a-lifetime spectacle.

You and your friends will have virtual front-row tickets with the Official Olympic Guide to Los Angeles, a lavish 300-page magazine that captures it all-the thrills of great Olympic moments past and present, future stars and hopefuls, records to break, maps, TV and dayby-day events schedules.

Everything from the magic of opening ceremonies to the final lap of the marathon, along with an indispensable guide to Southern California, including top attractions, dining, nightlife, tips and trips. All in breathtaking full-color photography and illustrations.

You, and your out-of-town friends, will share all the action of this memorable event with this special collector's issue that will become a cherished keepsake of the legendary rekindling of the Olympic flame in Los Angeles.

Order now and be ahead of the crowd. Send in your check or money order. Or call 557-7587 and charge it to your MasterCard or Visa. Official Olympic Guide, 1888 Century Park East, Suite 920, Los Angeles, California 90067.

Official Olympic Guide to Los Angeles at \$5.95 each, plus \$1.00 shipping and handling. Enclosed is my check or money order.

Notes For VIC And Atari Versions

Chris Poer, Editorial Programmer

The object of "Olympiad" is to defeat your opponent's three knights with three of your own in one-on-one combat. In the VIC version, player 1 controls his knight with the joystick while player 2 uses the keyboard (I, J, K, and M keys for up, left, right, and down movements, respectively). In the Atari version, the knights are controlled with joysticks 0 and 1.

When the game begins, position yourself directly in front of the enemy. Press the joy-stick button (or space bar in the VIC version) to fire an arrow. Arrows travel only a certain distance. In addition, each knight has only 20 arrows in his quiver, so be careful not to waste any. If both warriors exhaust their supply of arrows, the round will start anew, with each player receiving a fresh supply of 20 arrows.

The VIC version requires 8K or more of expansion RAM. Before loading the game into the VIC (right after the computer is turned on), carefully enter the following lines:

POKE43,1:POKE44,32:POKE8192,0:NEW POKE36869,240:POKE36866,150:POKE648,30 PRINT"[CLR]"

follow our path to the future of home computing.

Welcome to the next generation of home computer software and hardware...from **Futurehouse**. We help you get the most out of your computer. The most personal productivity, the most education, the most entertainment. The most for your money.

Follow our path to the future...

For your financial future...the Complete Personal Accountant is an award-winning line of money management software.

For your creative future...the **Edumate Light Pen** is a low cost, high performance peripheral which draws, entertains and teaches. It is rated the best in its price range and out performs even the most expensive light pens.

For your child's future...Playground Software, our educational series, uses the Edumate Light Pen and S.A.M. (Software Automatic Mouth) to teach and delight your children. The series includes Alphabet Construction Set, a unique program that teaches children how to draw the letters of the alphabet.

For your artistic future...with **Peripheral Vision** and an **Edumate Light Pen** you can create sophisticated works of art on your screen.

Choose from dozens of advanced graphics routines and then save your artwork to disk or print it on your printer.

Let **Futurehouse** lead you into the future with quality products for your home computer. Contact your local dealer or order direct 1-800-334-SOFT. Don't wait for the future...it's here.

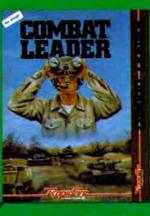

Futurehouse products are available for Commodore 64/Vic 20, Atari, TRS-80 Color, and IBM PC jr. computers. When ordering please specify computer, cassette or disk and memory.

All roads to the best strategy games for the ATARI® lead to SSI.

As the hero in this fantasy adventure roleplaying game, you must battle hordes of deadly monsters as you seek out to destroy the evil wizard, Mantor. Use your strength, dexterity, intelligence and charisma to the fullest in your treacherous journey to save the Questron Empire. On 40K \$49.95

Arcade-like graphics and action plus strategy-gaming sophistication and realism make COMBAT LEADER* one of the greatest tankbattle games ever! You can choose from over 70 historical and modern tanks. On 48K disk and cassette. \$39.95.

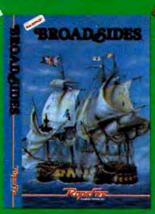

pilot of a World War II B-17 bomber in this role-playing game, can you survive 50 dangerous but exciting raids over France and Germany to earn the crushed cap of a true veteran? Find out as you travel back to 1942 as part of the 8th Air Force Bomber Group. On 40K disk. \$39,95.

STRATEGIC SIMULATIONS INC.

months of development time have gone into this game to make it the definitive division level simulation of the Russian War. You can re-enact the entire campaign from June 1941 through December 1944 or select one of 3 shorter scenarios. If you call yourself a real wargamer, you must play it! On 48K

This strategy/arcade game brings back all the romance and excitement of the adventurous age of fighting sail by letting you command your very own 18-century warship. You'll make all the military decisions a real captain must make, and you can even construct a ship of your own design. On 48K disk. \$39.95.

WEST!" is a sophisticated business/ educational game that takes you back to 1870. You'll wheel and deal as you try to build the richest Transcontinental railroad. For up to 8 players, it is fun, challenging, and exhaustive in detail and realism. On 40K

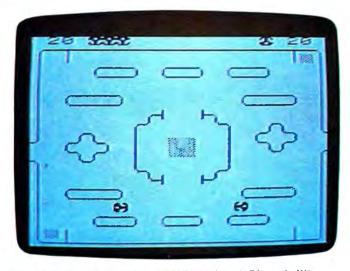

RAILS

For all our ATARI® games, write for your free copy of SSI's color catalog.

If there are no convenient stores near you, VISA & M/C holders can order direct by calling 800-227-1617, ext. 335 (toll free). In California, call 800-772-3545, ext. 335. To order by mail, send your check to: SSI, 883 Stier-

lin Road, Bldg. A-200, Mountain View, CA 94043. Please include \$2.00 for shipping & handling. (California residents, add 6.5% sales tax.) All SSI games carry a 14-day "satisfaction or your money back" guarantee.

IS YOUR CHILD TOP BANANA, OR JUST ONE OF THE BUNCH?

Kids everywhere are going ape over Artwork Monkey Series educational software! Like all good arcade games, kids just can't stop playing them. Which is great, because while they're enjoying the antics of Marc the Monkey, they're learning. And growing.

Three Artworx monkey programs, designed by teachers and learning specialists, are available to help your child.

Monkeymath™ uses colorful graphics and three levels of challenges to give a better understanding of number sequences, addition, subtraction, multiplication, and division.

Monkeymath

Monkeynews" uses a newspaper setting to increase your child's ability to read and understand by enabling him to actively participate in

the story, answer questions, check facts and type

his own headlines.

For help with spelling and vocabulary, choose *Monkeybuilder*. It encourages the child to combine word pieces correctly to form building blocks, and make a tree house for Marc.

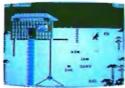

All three programs are more fun than a barrel of you-know-whats!

All are available for the Commodore 64, Atari, and Apple computers. All include a FREE Marc the Monkey story and coloring book. And they're all the stuff top bananas are made of!

See them in action wherever software is sold. To find out more facts, send \$1.00 for a colorful catalog to: Artworx Software Co., Inc. 150 North Main Street, Fairport, NY 14450.

Or call: 800-828-6573. (In New York call: 716-425-2833).

Games from MMG keep you on the rur

PYRAMID RUN by Mike Marsico & Ed Annunziata

You'll be running for your life when you enter the forbidden pyramid. You're the first person in over 3000 years to have successfully reached the bottom level of the Great Pyramid of the Egyptian Pharaoh Cheotemkahmen, supreme ruler of the Fifth Dynasty, and the jewels and riches are yours to collect! All that remains is to take whatever you can carry, and climb to the top of the pyramid. However, there are still one or two problems to overcome before spending your newly found wealth. The Great Royal Court Sorcerers of the Fifth Dynasty were charged by Cheotemkahmen with the responsibility of ensuring that his eternal sleep should be undisturbed. They ensured that the Demons of the Dark Places would be loosed on any trespasser, and now you've got to conquer them to reach your freedom. Monsters, lightning bolts, radioactive fire, and much more, lie between you and your escape. PYRAMID RUN is a race against time and the Demons of the Dark Places, set upon a scrolling view of the tunnels of the Great Pyramid. You may choose to begin at any of five levels of difficulty. Fantastic full color graphics and spectacular sound effects highlight this game, with dozens of the most hideous and original monsters in computer gaming. In addition, PYRAMID RUN is another of the MMG games which are two in one: as you complete each pyramid, you play a totally different interlude board, for the chance to win additional lives for your next, and more difficult run through the pyramid. PYRAMID RUN requires a disk drive, one joystick and 48K. Suggested retail price: 129.95

PHOENIX LAIR

It's a dangerous flight when you are the Phoenix on a search and destroy mission to find enemy eggs. At the beginning of each board, you must leave your nest in search of enemy eggs. After successfully destroying at least six of these eggs, you must return to the far right side of your lair. Points are awarded based on the number of eggs destroyed and the time it takes to complete the mission. A fast mission will result in additional bonus points. You begin with 5 lives and gain additional lives at boards 7, 9, and 10 (if you make it that far). The ten increasingly difficult boards can be played at any of ten speeds and the obstacles you will encounter will make your mission a nightmare. Multiple strategies and bright and lively colors and music add to the already superb play of this completely unique and different game. PHOENIX LAIR also features MMG's interlude board, a head-to-head joust with the Pharis Hailex, principal knight of the Kingdom of Pharis. Successful unseating of the Knight without being hit by his mount gains bonus points. It's like getting two games for the price of one. PHOENIX LAIR requires a disk drive, one joystick and 40K. Suggested retail price: '29.95

Typing Olympiad

All three versions of "Olympiad" make extensive use of keyboard graphics in drawing the arena display. To avoid confusion and possible typing errors, please refer to the article "How To Type COMPUTE!'s Programs" before you attempt to enter these programs.

For the 64 version (lines 3010-3220) and VIC version (lines 3010-3210), pay close attention to the places where program lines are divided on the page. If any spaces are to be left after the characters on one line of the page, the correct number of spaces will be indicated in braces at the beginning of the next line. Unless you are specifically instructed to type spaces, do not do so. For example, in the statement below there should be no spaces between the SHIFTed characters on the first line and the cursor lefts at the start of the second, and only four spaces (as specified in the braces) should be typed between the SHIFTed characters at the end of the second line and those at the beginning of the third.

```
400 PRINT"- FR JCCCCCK 2 SPACES JCCCCCK
    [6 LEFT] [2 DOWN] JCCCCCCCCCCCK
    [4 SPACES] JCCCCCK";
                                   :rem 128
```

In the Atari version, many special graphics characters are used in lines 3010-3240. Be sure you understand how to type these before you start. In particular, the vertical bar character (1) used frequently in these lines is obtained by pressing the SHIFT and = keys simultaneously.

You can get rid of your paper clutter... recipe files... names and addresses of friends... the membership list of your Garden Club... the list of lists is endless!

Just insert the MicroFiler cartridge into your Atari, set up the desired format, and type merrily away. Works with all models of Atari Computers with cassette or disk. When you want the information, there it is on your screen.

The MicroFiler will also work with a printer, letting you make labels and print lists...easily!

After your kids have destroyed the universe, you can find Aunt Martha's recipe for German Chocolate Cake, or balance your check book... in seconds!

\$49.95

Cut your programming time from hours to seconds, and have 33 direct mode commands and functions. All at your finger tips and all made easy by the MONKEY WRENCH II.

The MONKEY WRENCH II plugs easily into the cartridge slot of your ATARI and works with the ATARI BASIC

Order your MONKEY WRENCH II today and enjoy the conveniences of these 33 features:

Line numbering

Renumbering basic line numbers

Detetion of line numbers

Variable and current value display

Location of every string occurrence

String exchange Move lines

Copy lines

Up and down scrolling of basic programs

Special line formats and page numbering

Disk directory display Marains change

Home key functions

Cursor exchange

Upper case lock Hex conversion

Decimal conversion

Machine language monitor

DOS tunctions

 Function keys The MONKEY WRENCH II also contains a machine language monitor with 16 commands that can be used to interact with the powerful features of the 6502 microprocessor

"The Rabbit" for your VIC 20 or CBM 64

If you own a VIC 20 or a CBM 64 and have been concerned about the high cost of a disk to store your programs on worry yourself no longer Now theres the RABBIT. The RABBIT comes in a cartridge, and at a much much lower price than the average disk. And speed... this is one fast RABBIT. comes in a camage, and at a much much lower price than the average disk. And speed—this is one last RABBIT With the RABBIT you can load and store on your CBM datasette an 84 program in almost 30 seconds compared to the current 3 minutes of a VIC 20 or CBM 64, almost as fast as the 1541 disk drive.

The RABBIT is easy to install, allows one to Append Basic Programs, works with or without Expansion Memory, and provides two data file modes. The RABBIT is not only fast but reliable.

(The Rabbit for the VIC 20 contains an expansion con nector so you can simultaneously use your memory board, etc.)

NOW THE BEST FOR LESS!

Please for your own protection consider the MAE first before you buy that other assembler. We've had

\$39.95

numerous customers who wasted their money on some cheaper off brand assembler tell us how much better the MAE is. The most powerful Macro Assemble/Editor available for the Commodore 64 and other CBM/PET computers, and also for the ATARI 800/XL and Apple II/IIE.

MAE includes an Assembler, Editor, Word Processor, Relocating Loader, and more all for just \$59.95.

We could go on and describe the MAE but we thought you would like to read our customers' comments. The following are actual unedited comments from correspondence about the MAE:

Excellent Development Package:

"My Compliments to Carl Moser and EHS.

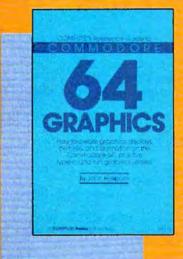

"Compares to DEC and INTEL." "It is a superb program"

3239 Linda Dr. Winston-Salem, N.C. 27106 (919) 924-2889 (919) 748-8446 Send for free catalog!

COMPUTE! Books

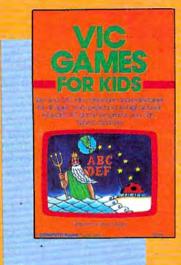

COMPUTE!'s Reference Guide To Commodore 64 Graphics

A complete tutorial on Commodore 64 graphics. Noted Commodore author John Heilborn explains how to program sprites, multicolored screens, animation, custom characters, and more. Beginners will like the step-by-step instructions and clear example programs. Advanced programmers can build up

their tool kit with the character editors, sprite editors, screen design program, and other useful utilities.

218 pages, paperback. Spiral bound for easy access to programs.

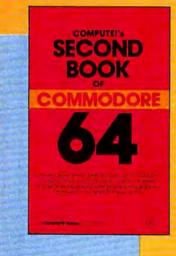

\$12.95 ISBN 0-942386-29-9

VIC Games For Kids

Contains 30 games written just for kids (although adults will enjoy them too). This book is an inexpensive source of educational software for children. The games are designed to teach math, geography, history, and other topics. Children learn while they're having fun. They will return to these games again and again.

240 pages, paperback. Spiral bound for easy access to programs. \$12.95 ISBN 0-942386-35-3

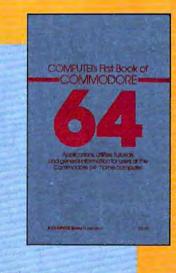

COMPUTE!'s Second Book of Commodore 64

Continues in the tradition of the best-selling First Book of Commodore 64 in presenting quality programs and articles, many revised or never before published. There's something for almost any 64 user: arcade and text adventure games, an impressive word processor, a program which adds 41 new BASIC commands, an

electronic spreadsheet, sound and graphics tutorials, and information on saving, copying, and retrieving files.

288 pages, paperback. Spiral bound for easy access to programs.

\$12.95 ISBN 0-942386-44-2

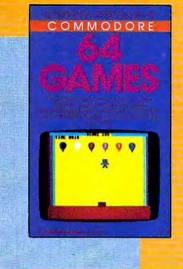

COMPUTE!'s First Book Of Commodore 64

An excellent resource for users of the 64, with something for everyone: BASIC programming techniques, a memory map, a machine language monitor, and information about writing games and using peripherals. Many ready-to-type-in programs and games.

264 pages, paperback. Spiral bound for easy access to programs.

\$12.95 ISBN 0-942386-20-5

COMPUTE!'s First Book Of Commodore 64 Games

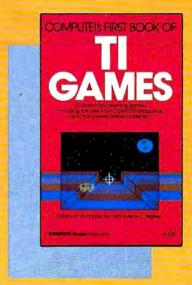

Packed full of games:
"Snake Escape," "Oil Tycoon," "Laser Gunner,"
"Zuider Zee," and many
more. Machine language
games requiring fast hands
and a good eye, as well as
strategy games which will
exercise your mind. Introductory chapters and annotated listings provide
ideas and techniques for
writing games. An excellent

introduction for 64 owners who want to begin writing games.

217 pages, paperback.

Spiral bound for easy access to programs. \$12.95

ISBN 0-942386-34-5

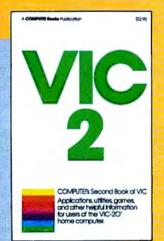

COMPUTEI's First Book Of TI Games

Although this book is packed with ready-to-type-in games (29 in all), it is more than just a book of games. It is designed to teach game programming techniques. Introductory chapters explain the special features of the TI-99/4 and 99/4A, giving advice on coding techniques. Most games include an explanation of how the program works. Contains mazes,

chase games, old favorites, thinking games, creative challenges, and more.

211 pages, paperback. Spiral bound for easy access to programs.

\$12.95 ISBN 0-942386-17-5

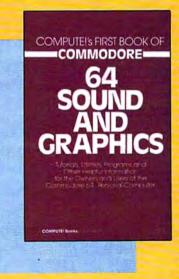

COMPUTE!'s Second Book Of VIC

This is just the book to follow the best-selling First Book of VIC: clear explanations of programming techniques, an extensive memory map, a mini word processor, a system for creating sound effects, a custom character maker, a machine language assembler, and "Gumball," an extraordinary all-machinelanguage game.

274 pages, paperback.
Spiral bound for easy access to programs.

\$12.95 ISBN 0-942386-16-7

COMPUTEI's First Book Of 64 Sound And Graphics

Clear explanations of the 64's sound and graphics capabilities. Includes many tutorials and example programs: "MusicMaster," a complete music synthesizer; "High-Resolution Sketchpad," an all-machine-language program for making computer art; and "Ultrafont Character Editor," one of the best character editors available. The appendices feature

useful reference charts and conversion tables.

275 pages, paperback. Spiral bound for easy access to programs.

\$12.95 ISBN 0-942386-21-3

REVIEWS

MailPro Elizabeth Deal

MailPro, by Pro-Line Software Ltd., is a general filing system for Commodore computers. Versions are available for PETs with 4.0 BASIC as well as the Commodore 64. The Commodore 64 version is reviewed here. I believe that other versions have comparable features.

MailPro works well with WordPro, Pro-Line's word processor, and may well be compatible with others, since it outputs normal sequential files.

MailPro on the Commodore 64 uses one 1541 drive and just about any kind of printer. It is up to you to describe the configuration.

A General Data Manager

MailPro is designed to handle mailing lists, but can just as easily handle any kind of information you need to store: catalogs of records or books, bibliographies, student records, or any kind of business files.

The manual is complete. It takes the user from the beginning of setting it all up, through all its variations, to the results. It is both tutorial and descriptive. The only thing I miss in the book is an index of all available keys and functions: A summary would be nice to have. But a list of contents is clearly shown up front, so finding information is not difficult.

The best illustrations are at the end of the book, where a complete example is thoroughly worked out. If anything is unclear in the manual, it becomes easily understood when you go through that example.

MailPro is a pleasure to use. The screen prompts are well done, and it is difficult to botch a job—the computer helps you while you're creating and retrieving files. Setting up the original file is easy; just specify what sort of information will be stored: alphabetic, numeric, yes-no type, sorted, not sorted, etc. The maximum length of each variable is specified next, and so on; you design the screen as you go along. The screen can scroll sideways if any field is larger than 40 columns.

Simple Data Entry

Entering the information is simple, too. Cursor keys act as they normally do on the Commodore computers, with some elaborations. For example, you can jump from field to field easily by using the cursor keys. You can edit the information, and easily abort any function.

Mailpro permits manual entry. It also works with existing files, and allows the user to combine the two processes to manually fill in missing information during file entry. It's a wellthought-out, flexible system.

In addition, MailPro can process an existing WordPro sequential file. This worked very well in my PET-64 system. Mail-*Pro* just gobbled up the whole WordPro file in no time, filling in the variables I defined. The computer did all the tedious work a million times faster than I could have.

Vanguard VisiCorp

Ziff-Davis

Introducing the first computer shopping service that brings you convenience, savings and enjoyment.

Here's your chance to expand the practical uses of your personal computer.

Sign up for CompuServe and shop in our new Electronic Mall. It's easy to use. It tells you more about the products you're buying. It lets you order faster. And it's totally unique.

CompuServe's new Electronic Mall* offers you all these shopping innovations.

– It's enormous! So it gives you in-depth information on thousands of goods and services, and lets you buy even hard-to-find merchandise. – Its unique "Feedback" service lets you ask the merchants themselves specific questions. – It's incredibly efficient in ordering the products and services you want. Its special discount opportunities make it economical, purchase after purchase. – And its name-brand merchants assure you of top-quality merchandise.

Make the CompuServe Electronic Mall 15-Minute Comparison Test.

What you can do in 15 minutes shopping the Electronic Mall way.

- Call up on your computer screen full descriptions of the latest in computer printers, for instance.
- · Pick one and enter the order command.
- Check complete descriptions of places to stay on your next vacation.
- Pick several and request travel brochures.
- Access a department store catalog and pick out a wine rack, tools, toys...any thing!
- Place your order.

What you can do in 15 minutes shopping the old way.

· Round up the family and get in the car.

The Electronic Mall, a valuable addition to the vast world of CompuServe.

CompuServe's Consumer Information Service brings you shopping information, entertainment, personal communications and more.

You can access CompuServe with almost any computer and modem, terminal or communicating word processor.

Prices subject to change without notice. All products subject to availability from manufacturers and/or suppliers. All prices in U.S. dollars.

Excellent Search Features

Retrieving information by a selected name, number, or category is easy and fast. Retrieval can be keyed to one or more variables at a time, and ranges can be set up. You may ask for information that falls within or outside a certain range of values (who hasn't paid my bills? who owes between \$50 and \$100?).

Changing information also is easy. You can add records at any time, of course, and change the information in existing records.

For straightforward data retrieval, use the screen. If you ask for JONES, all the records (one at a time) containing JONES are displayed. You can ask to go forward or backward in the file, of course.

Fancier retrieval involving complex search criteria can be performed on the printer (or disk). Here you define the output format. It can be a simple list, or it can be a fairly complex report with headings, paging, and extra text.

A Report Generator

The versatility of the system really shows up in the report generator. Instructions for producing reports take up about half of the entire manual.

MailPro writes relative files. The total record length can be 254 bytes; the total number of records on one 1541/4040 floppy is over four thousand. A batch of 127 records can be entered at one time, and the information is sorted during entry. It's a complex system of sorting, and an elegant one, with unlimited key fields. The manual warns that the original sort can take quite awhile, but I haven't run into any serious time delays yet.

Several files are set up, including descriptive files of each field, field sort information, and, of course, the data you enter. In addition, there are output de-

scriptor files, which allow the user to define and redefine up to ten different output formats (printer or sequential disk files). The output format files are of the USR type, but they are created as normal files, so that the disk VALIDATE (COLLECT in BASIC 4.0) does not erase them.

File Conversion

The relative files can be read by MailPro, but the program can output sequential versions of those files. They can contain all of the original information (in sorted order on the variable of your choice) or any selected portions of it—perhaps only addresses of people who live in a certain zip code area. Those files can then be easily read from another program such as WordPro or a BASIC program of your own making.

MailPro's main options include looking at the disk directory of existing files, creating new files, editing field names, adding records, recalling them, entering new records (manual or merging), and printer or disk output.

The editor options include use of the cursor keys and function keys.

To create a new file, these options are available: specifying number of fields, their sizes (maximum 99 characters per field), and type (alphabetic, numeric, yes/no, sorted/unsorted, etc.).

File Management

To manage an existing file, you can display and print a record, change the information, delete a record, and add records, in a variety of ways.

To specify how a final report is to look, you can ask for a simple listing of everything on a file (such as mailing labels) or you can ask for output of records that match specific criteria. The formatting features include right and left justification, aligned decimal output, compressed output (no spaces), page headings,

page numbering, overall margins, sequencing, and tabbing. Print formats can be stored for later use, and up to ten can be defined. They can be redefined at any time. The existing screen image can be dumped to a printer at any time.

Overall, MailPro is fairly easy to set up, use, and maintain. It permits easy report generation. It is flexible for use with any kind of data. The sequential files written by Mailpro can be read into WordPro or used as standalone files for other systems. The disk management is excellent, errors are trapped, and the files can be copied or duplicated by normal procedures. The whole system is solidly built. If you need a versatile data manager, this one is worth looking into.

Promenade EPROM Programmer For VIC And 64

Sheldon Leemon

Most computer users would agree that cartridge-based software, which plugs right into the computer and is ready to run instantly, is the most convenient to use. In order to create software cartridges at home, however, you need a machine to store programs on EPROM (Erasable, Programmable Read Only Memory) chips.

Some EPROM programmers are difficult to use or prohibitively expensive. One notable exception is the Promenade from Jason-Ranheim. Most programmers in its under-\$100 range are little more than bare circuit boards which may be difficult to install. The Promenade, however, is a professional-looking unit which comes in a compact aluminum case approximately 4½ inches square.

It plugs directly into the user port on the back of the VIC or 64, and since it takes all of its power directly from the computer, no other connections are necessary. On the top of the case is a high-quality Zero Insertion Force socket. There are also three colored LEDs, which indicate when the unit is receiving power, when the socket is activated, and when actual pro-

Versatile Programmer

gramming is taking place.

Its performance is even more impressive than its looks. Most programmers in its price range will only program a few lower-capacity EPROMS such as the 2716 or 2732 types. Others require that "personality modules" be added for each additional EPROM type. The Promenade, however, has several different programming voltages available under software control, so that it can program almost any type of EPROM OR EEPROM

now available.

The PROMOS 1.0 programming software, which accompanies the programmer, adds several new commands to BASIC. These commands are used to transfer data between the computer and the EPROM in the Promenade's socket. Besides being convenient to use, these BASIC commands offer several "smart" programming methods. This means that instead of taking seven minutes or more to program an 8K 2764 EPROM, the Promenade may be able to finish the job in eight or nine seconds.

The only part of this package that is less than first-rate is the instruction manual. Though adequate for the more experienced programmer, it is probably too brief for the total novice. Update sheets have recently been sent to registered owners, however, giving step-by-step instructions for saving BASIC and machine language programs on autostart cartridges. Further revisions of the manual are on the way.

Besides offering Promenade programmer, Jason-Ranheim also sells an assortment of blank EPROMS and cartridges.

Promenade EPROM programmer Jason-Ranheim 580 Parrott Street San Jose, CA 95112 \$99.50, including PROMOS 1.0 programming software for VIC and 64 (on tape)

Stickybear

Larry Ross

There has been a sudden increase in educational software for preschoolers and young children. Much of this software has been created to fill a gap, but cannot really be considered quality products. The Stickybear series, however, is an exception.

Stickybear ABC and Stickybear Numbers are educational programs designed for children ages three to six. Stickybear Bop is a game that the entire family can enjoy. All three programs emphasize graphics, sound, and simplicity. There are no menus or screen directions to deal with. The operation is straightforward. They are available for the Apple II or II + with 48K and one disk drive (DOS 3.3).

Stickybear ABC

Stickybear ABC is designed so that even a three-year-old can operate it. The child simply presses a letter, and a beautifully animated high-resolution picture, complete with sound effects, appears on the screen. When the same letter is pressed again, a completely different picture appears.

The screen display features a large version of the letter which is selected. A word beginning with this letter is shown in uppercase.

The main objective of the program is to introduce the letters of the alphabet to the user and illustrate words beginning with these letters. In addition to this, Stickybear ABC is a thoroughly enjoyable way to accustom children to a computer. A basic introduction to the keyboard is also provided.

Stickybear ABC is part of a complete package. It is accompanied by The Strawberry Look Book by Richard Hefter, the creator of Stickybear and the illustrator of each of the Sticky-

A bear blowing a whistle is one of the displays that appears when a child using Stickybear ABC presses the W key.

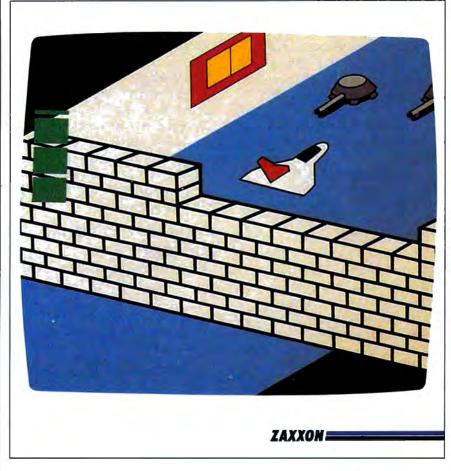

bear programs. This book is an account of what the bears see when they go shopping. The name of each item is printed next to it. The package also includes a direction card, a poster depicting each letter as it is shown in the program, and a sheet of Stickybear stickers.

Stickybear Numbers

Stickybear Numbers graphically illustrates the numbers from 0 to 9. Here, too, operation is simple

and the graphics and sound are excellent. The child can operate the program either by pressing a number or the space bar. Each time a number is selected, it is animated. The animations range from Stickybear scooping up sundaes to penguins jumping out of the water onto ice. As each number is pressed, a different picture appears. The pictures are randomly selected by the computer.

If the space bar is chosen instead of a number, the animation process is different. The first time the space bar is pressed, the number one is illustrated. The second time, one more object appears on the screen in the same setting until nine objects are finally depicted. Pressing the space bar after this point results in one object at a time being erased from the screen until no objects appear. This completes a cycle and another press of the space bar randomly accesses a

Stickybear puckers up to kiss his mate when the K key is pressed in Stickybear ABC.

new animation and starts the procedure over again.

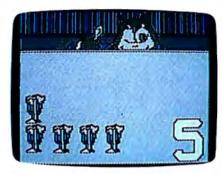

Stickybear Numbers is also part of a complete package which features a direction card, the One Bear, Two Bears number book by Richard Hefter, a Stickybear number poster, and a sheet of Stickybear stickers.

Stickybear Bop

Stickybear Bop is the game program in the Stickybear series. With a shooting gallery theme, the game opens as a large, smiling Stickybear moving slowly by, tipping his hat. At the same time, planets, ducks, and hats pass above him. The object of this round of the game is to "bop" ten objects off the screen using the flipper and ball which are positioned at the bottom of the screen. The player is supplied with ten balls. Each time an object is missed, the player loses a ball. The game ends when all ten balls have been used.

There are six rounds, each with different graphics. As objects are "bopped" off the screen, points are awarded and recorded in the score box. If a player is able to finish round six, there are still additional items to be bopped and the game continues.

While the game is designed for the whole family, young children will find round two to be difficult, though rewarding. Time and practice will help them improve. This is a good game to play as a family.

Stickybear Numbers graphically illustrates the numbers from 0 to 9. Here, Stickybear is about to eat 5 ice cream sundaes.

The graphics and animation are as appealing in *Stickybear Bop* as they are in the other two Stickybear programs. The program package includes a direction card, a poster of Stickybear, a Stickybear sticker sheet, and a Stickybear Bop game.

All three programs demonstrate their creators' awareness of what appeals to children.

In Stickybear Bop, the player uses a paddle or joystick to launch a ball that knocks out the objects Stickybear juggles.

Also, there appears to be a commitment to introducing the computer to children cleverly, enjoyably.

Two Games Of Strategy

Dale F. Brown

Avalon Hill has produced several high-quality strategy computer games that should challenge and interest nearly everybody. These games are written in BASIC—proof that fast-action, nervetingling computer games can still be written without machine language.

Computer Football Strategy

When my TV isn't doing word processing with the computer, it's usually tuned to a football game, so naturally the first Avalon Hill game I picked was Computer Football Strategy for the Commodore 64. The game display shows the football field as a small, thin strip divided with ten-yard lines. While you are playing, four graphics characters (two for the offense and two for the defense) run back and forth

on the field with the ball. It has no resemblance whatsoever to a real field, and it's not designed to simulate a real game. A field with X's and 0's would have been more useful.

Above the field are the game statistics and scoreboard information. Below it are the displays showing the offensive and defensive play options. (You can play the computer, play another person, or have the computer play itself.) Each side picks either an offensive or a defensive play, and the ball advances depending on the plays called.

Each player has a playbook with all of the possible offensive plays paired with all the possible defensive plays, showing their outcomes. The offensive play has a certain amount of time built into it (it is not a realtime game), so you can either take

the play or call a time-out and call another play.

The most impressive feature of this game is the numerous offensive and defensive options available. As quarterback, you can call 20 different plays from scrimmage, and depending on the defensive alignment, there can be ten different outcomes to each play. If you truly get into realistic role-playing in this type of game, you can re-create an actual football game with surprisingly accurate results.

However, I was expecting to watch my quarterback drop back to pass, watch my receivers run their button-hooks or downand-ins, or watch my linebackers do their inside blitz, but the display doesn't show any of that. Also, some of the plays take some time. A sideline pass for a short 5- or 10-yard gain sometimes takes 10 to 15 seconds, and there are no hurry-up offenses. The game might be more realistic if more clock control were allowed.

This game is best when you play another person, rather than the computer. Maybe it's just sour grapes, but I seemed to get more penalties and fewer touchdowns while playing the computer. I always do better against a human opponent.

Take To The Skies

If I rated Computer Football Strategy as good, Avalon Hill's B-1 Nuclear Bomber rates a solid better. In B-1 Bomber, you are the captain of a supersonic bomber on airborne'alert. As the game begins, you receive a message containing a fail-safe arming code, your primary target, a list of alternate targets, and a longer list of enemy defense complexes that can be targets for one of your six multipurpose Phoenix missiles. Your job is to fly your plane to the target of your choice, evading or countering the defenses along the way, and launch your single Short-Range Attack Missile (SRAM) at the target.

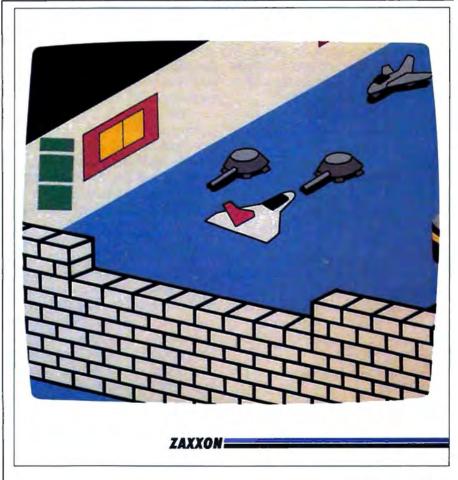

At the beginning, the game is agonizingly slow. Even flying at 4500 kilometers per hour, it will take you several minutes of simple droning to even get within range of a defense complex that may take any action against you.

Here's where the strategy comes in. You can attack any target on the list with your SRAM, and you can launch your Phoenix missiles at any defense complex in range. This means you can attack a base, then turn around and head for home before too many attackers find you. You can choose to fly around the enemy defense bases, or attack them head-on. You can launch your missiles at attacking fighters, or save them for the bases. Will you run out of missiles before you get to the enemy bases, or will you try to save the missiles and rely on electronic countermeasures (ECM, or jamming) and violent evasive maneuvers

to defeat the enemy fighters and surface-to-air missiles?

The action in the target area more than makes up for the long minutes of boredom flying towards the target. Once you reach the target area, you enter the fail-safe code to arm the attack missile. Here's where the action really begins. Arming the SRAM acts like a beacon to the enemy, saying "Hey! Here I am!" Soon, your screen fills with attackers. Each radar search tells you what kind of threat is attacking and how long it will be before it attacks. If you've used too much ECM before now, it becomes less and less effective. Evasive maneuvers start to use up more and more fuel and place you closer and closer to the ground.

The back of the game manual has a map of the targets and defense complexes. The computer will give you a heading toward any base you select, but you must put in your own head-

ings if you've run out of missiles and don't want to overfly a defense complex. A heading of 90 is east (right), 180 is south (down), etc.

The cockpit display is rather disappointing. There is a graphic depiction of a bomber cockpit, with a control column and throttles, but they don't really do anything and are a little distracting; some cockpit gauges or a simple route map might have been more interesting. The very bottom of the display shows present course, fuel, missiles remaining, speed, and primary target, but they're hard to read and hard to understand. The commands for navigation, defensive measures, and launching missiles are easy to understand, though.

Again, the game is not in realtime. Each command takes a certain amount of preprogrammed time, so an evasive maneuver command may not have enough time to be fully executed before an attacking missile explodes in front of your plane. It takes a little practice to get the timing down, so eventually you'll know what to do when the computer says, "a Mig will intercept in 32 seconds!"

In B-1 Nuclear Bomber, you can take advantage of the fact that these games are written in BASIC. Do you think six Phoenix missiles are too few for a beginner? Is 4500 kilometers an hour too slow? Is 24,000 pounds of fuel to start too little? A little poking around the program can change those parameters until you get more familiar with the game.

These two games are available for most popular microcomputers at prices ranging from \$16 for tape to \$21 for disk.

Computer Football Strategy B-1 Bomber The Avalon Hill Game Company 4517 Harford Rd. Baltimore, MD 21214

Operation Whirlwind

James V. Trunzo

Operation Whirlwind, by Brøderbund, is a new and unique computer war game for the Atari 400/800/1200 computers. Brøderbund, heretofore better known for their superior arcade games and more recently their word processor, Bank Street Writer, has released a World War II strategy game that is in many ways, an original.

Computer war games usually bring to mind endless hours of tedious movement and even more tedious perusing of a booklength set of instructions. *Operation Whirlwind*, however, is simple to play, yet authentic and challenging.

All The Classic Moves

Operation Whirlwind, while not based on any specific battle or operation, adheres to all the subtleties that go into a first-class war game.

Terrain, movement, firepower, range, line-of-sight, and unit disorganization are all incorporated into the game without the usual burden of a multitude of charts and tables.

The sequence of play for Operation Whirlwind consists of one turn broken into five distinct phases, each activated with a joystick and, on the Atari, the yellow function buttons. No keyboard input is required during any phase of the game.

The first phase is the Command Phase, during which you can either order your units to dig in or keep them combatready. A unit that has dug in regains lost combat strength through reorganization and rest. They can defend their positions, but they cannot assault a position or move. Like all orders throughout the game, you give a combatready or dig-in order by placing a hollow square cursor over a unit and pressing the joystick button.

Armies On The Move

The second phase is the Movement Phase. Use the joystick to place the cursor over a unit, then press the joystick button to begin the unit's movement. Movement must be either horizontal or vertical. Movement rates vary, depending upon unit type, terrain being traversed, and remaining unit strength. Movement can also be halted by severe enemy fire or by damage from hitting mines.

It should be noted that an enemy unit is invisible until it is spotted by your recon units or it fires on your units. Mines are never visible.

Movement is completed by pressing the fire button again and releasing the piece. You can move all, some, or none of your units each Movement Phase, and each unit can move its entire allotment or only part of it.

Using all of a unit's movement allotment, however, prohibits it from firing during the turn. To indicate that you are approaching total depletion of activity points, the cursor turns red.

Combat Is The Action Phase

The third phase is the Combat Phase. Unseen enemy artillery starts to shell your troops, and sighted enemy units also open fire. To return fire, place the cursor over the unit which is to fire and press the fire button.

The cursor turns into a blinking cross hairs which you then move from the firing unit to its target. Press the fire button again to activate the shot. Several things can occur at this time: 1) You can score a hit (don't count on any single hit taking out an enemy unit); 2) you may get a message indicating that the target is out of your range; or 3)

you may get a message indicating that your line-of-sight is blocked. The number of shots each unit receives is determined by how much movement it did prior to the combat phase.

Assault Order Phase

The fourth phase is the Assault Order Phase, during which units with activity left (those not using it all during the movement and combat phases) can assault enemy units adjacent to their positions. Assaults, or overruns in the case of tanks, are devastating attacks, but they also inflict many casualties on the attacking

Assault orders are used for a second important purpose. There are two rivers that must be crossed before getting to the occupied city. To cross them, your engineer units must build new bridges. This is handled by placing an engineer unit next to the river and giving it an assault order. All orders are given via

joystick, with the cursor turning into an arrow to show the direction of the assault.

The fifth and final phase is the Assault Phase. All assault orders given in phase four are carried out during this phase, though not always successfully. It might, for example, take several turns to build a bridge or dislodge a strong defending enemy unit.

At the end of this phase, enemy units may move, either in retreat or simply in an attempt to fortify their defensive positions. They will fire a parting shot at any unit in their range as

To get from one phase to the next, use the yellow function keys. Press the START key whenever you wish to move from one phase to another, and you are on your way.

This description of the phases is simplified. Much strategy and planning are involved in all areas, and there are many programming niceties such as cursors changing color to indicate that various events have occurred during the game sequence.

Assessing The Action

When you have completed all five phases, you have completed one turn. You will be informed of your chances for victory (doubtful, marginal, tactical, etc.), and you will be asked whether or not you wish the game to be saved before starting the next turn. Saving (and reloading) a game is accomplished with the yellow function keys. Games may be saved to either the master disk or to a formatted. unused data disk.

The game has four difficulty levels. In addition, each level of difficulty can result in one of five levels of victory or defeat. Furthermore, the computercontrolled German forces will randomly employ one of four different strategies to add to the

variety and enjoyment of play.

Realistic Sound And Graphics

Operation Whirlwind has excellent sound effects and a good graphics rendition of typical war-game unit and terrain symbols. Even when viewed on a television instead of a monitor, the symbols are sharp, making unit identification easy.

The cursor movement and scrolling are smooth, which is important because the battlefield is about three television screens wide.

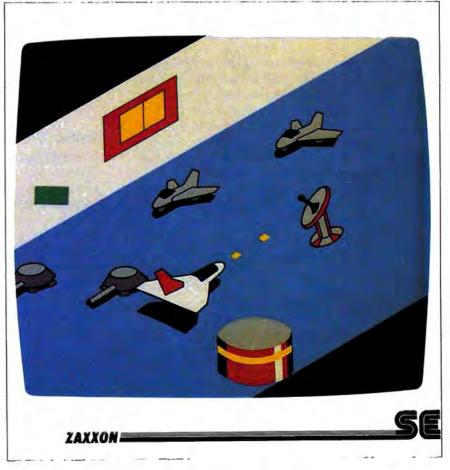

Operation Whirlwind differs from some other war strategy games in that it concentrates on a single, ongoing battle with a single, well-defined objective rather than trying to simulate a far-flung campaign. Just as you are celebrating your conquest of the German-held city, you are greeted by the sounds of the marching units that make

up the unrelenting German counterattack.

On The Road With Fred D'Ignazio

The Morning After: Anti-Computer Backlash And The Arrival Of The Mass-Market Home Computer

Part 2

In this month's column, we conclude the text of Fred's speech at the West Coast Computer Faire. Part 1 appeared last month.

A Failure To Explain Computers

What could make computers go out of style? What could make the market for home computers

dry up?

First, the personal computing revolution is already nine years old, yet the revolution's leaders (computing educators, manufacturers, authors, journalists, and spokespersons) have still not succeeded in explaining computers to the average person. Underneath the surface, the average person remains just as fearful, just as ignorant of computers as he was nine years ago.

Second, the computer industry has persisted in focusing on hardware and high technology instead of on human beings and human needs. Computers and computer programs have evolved based on their own logic and strengths rather than on human nature and human psychology. Most of the industry's imagination has gone into making the computer a gaudy "show-off" machine rather than on tailoring the computer to average human beings who want only to think like human beings, work like human beings, and have fun like human beings, and not like computers.

We need a new generation of computer programs which reflect the workings of the human mind. We have had enough computer programs that put human minds on the rack and try to squeeze them and stretch them to become more computerlike.

A Wellspring Of Resentment

Last, the computer industry, in its well-founded enthusiasm and zeal, has not been completely honest. Advanced computer applications are shown regularly on TV commercials. The average consumer sees these commercials, so he thinks that his \$50 computer will be able to do something similar. His expectation, of course, is absurd. But it is creating a huge wellspring of resentment and disappointment among disgruntled consumers who discover that their low-cost home computer cannot perform the miracles that computers in TV ads commonly perform.

Educational Advertisements

Manufacturers should respond quickly and directly to this growing consumer backlash to computers by beginning a series of educational advertisements on TV and in the other media. For purely commercial reasons, these computer ads should be carefully designed, ongoing tutorials on the fundamentals of computing.

Manufacturers can begin their campaign by showing bare-bones computers. They can explain that low-cost computers are "kits" that require lots of time, effort, and money before they can do

anything useful.

In later ads manufacturers can take consumers by the hand and show them how they can put their kits together, how they can "grow" theirkits into full-fledged computers, and how they can buy full-fledged computer systems outright.

Preventing A Consumer Backlash

To prevent a consumer backlash against com-

puters, manufacturers need to advertise computers honestly; they need to start educating the average consumer. In addition, they need to admit that computer software is far more important than hardware. The simplest, most ugly computer can be a better buy than an advanced computer if it comes with good, easy-to-use software.

In addition, manufacturers need to design new computers that are more suitable for the average consumer. Low-cost, bare-bones computers should still be offered. They meet the needs of people and groups who operate on a tight budget. And they are perfect programming laboratories for young people who will become our next generation of software inventors, engineers, designers, artists, and entertainers.

However, manufacturers should also offer higher-priced computer systems that come completely bundled with hardware and software. The entry-level computer system should come with at least 256K of memory (for powerful yet simple software), a built-in modem, a disk drive, and a printer. And it should come, at minimum, with a library of software, including a word processor, an electronic notebook, a file cabinet, communications software (a post-office, mailbox, library, telephone program), a spreadsheet program, and a calendar-scheduler program.

Computer systems should also come with a

program (like "Apple Presents Apple") that lets the computer introduce itself. And every program on the computer should have the responsibility to teach the new user how it (the program) works.

The First Mass-Market Computer

Into this rapidly evolving market comes the IBM PCjr. This computer arrives at a fateful time. It may well become the catalyst for a new generation of mass-market home computers.

According to many industry experts, the PCjr is something of a disappointment as a computer. But this is absolutely inconsequential! From the looks of things, the PCjr will probably still emerge as the standard in the home computer market the way its big sister, the PC, has emerged as the standard in the business

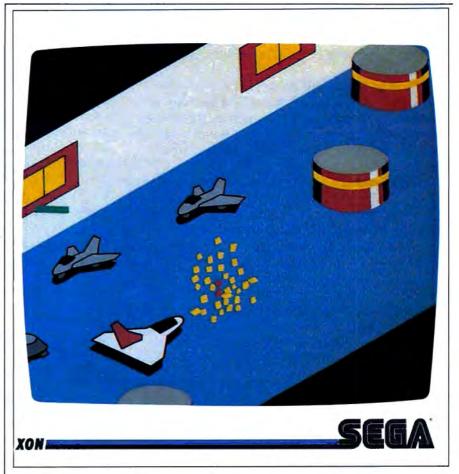

The PCir is attracting thirdparty software and equipment

the way the Apple computer did before it. But there is an important difference: The industry has grown and matured enormously since the introduction of the original Apple computer.

What does this mean? It means that thirdparty support for the PCjr is materializing much faster than it did for the Apple. It means that, within a year to 18 months, there will be a vast supply of equipment and software for the PCir. It means that the quality of this equipment and software will be as advanced as anything that is on the market. The guidelines for the best new computer products are low cost, productivity, friendliness, and simplicity. The products for the PCjr that incorporate these features will be a better buy than older products for home and business computers, products that probably cost hundreds of dollars more.

All these developments will totally transform the PCjr. Within a year after its introduction, the basic PCjr computer will cease to be of any consequence. Instead, all that will matter will be:

- The quality and variety of its third-party software.
- The quality and variety of its third-party equipment.
- The IBM name and reputation for stability and excellence.

 IBM marketing, technical support, handholding, and service.

Splitting Into Two Markets

The PCjr, as a galaxy of hardware, software, and equipment, will reflect the emerging sophistication of the American consumer. If it is marketed honestly, it may play a major role in educating the American consumer and in combating anticomputer backlash.

The PCjr should be sold at two levels. The less expensive model will appeal to people on a tight budget, to schools and budding computer inventors, and to the computer literates. It is a computer "kit" for people who want to learn more about how computers work or who have to do their computing on a shoestring.

The more expensive model will become the preferred computer of the computer intimates. Computer intimates will choose their computer the way they buy their home stereo. They will purchase the complete computer with all its components and with a library of record albums (software). They will want to take the computer home, plug it in, and let it become the heart of a family work station, communications network, and entertainment center.

A New, Expensive Standard

By mid-1985 the Japanese will be ready to follow IBM into the U.S. home computer market. By then the market will have consolidated, matured, and stabilized to the point where the risk of entering the market will be small and the rewards will be immense.

By mid-1985 a full-blown PCjr, with supporting third-party equipment and a library of software, may well have emerged as the home computer industry standard. But it will be an expensive standard, thus severely limiting the market size.

This is where the Japanese come in with their proven ability to market high-quality, high-technology products at a mass-market price. The Japanese will offer the lower-priced computer "kits," but they will concentrate on mass-marketing complete systems at only a fraction of the price of the PCjr and its clones and look-alikes.

As a result of the entry of IBM, and later the Japanese, by 1986 computers for the first time may become a truly low-cost, mass-market home appliance. Christmas 1986 will be like Christmas 1983, but with Americans buying millions of bundled home computer *systems*.

Software At The 7-11

The biggest revolution over the next three years will not be in home-computing computer hardware or software. It will be in software distribution.

Today the computer software industry is a

dwarf about to become a giant.

Until now, the software industry's offerings have been narrow, primitive, and far too expensive for mass-market merchandising. The problem has been the medium on which the software is distributed—cassettes, diskettes, or ROM cartridges. The medium was either cheap but slow and inappropriate for large programs (tapes), or fast but too expensive and too limited in memory (cartridges), or fast and spacious but expensive (diskettes).

There are more than 35,000 computer programs on the market, stored on a tape, cartridge, or diskette. But buyers can afford to buy only a few programs apiece because of their high cost, and because there has been no way to evaluate or preview the programs. At the same time, retailers are reluctant to stock a large number of programs because program packages are bulky, and programs have a limited shelf life. (Like records and books, they stay "hot" for only a short time.) The retailers are afraid of acquiring a big inventory of programs that aren't moving.

But the software industry is on the verge of changing—suddenly and explosively. Software manufacturers have now found an amazing shortcut—a new way to distribute their products. Over the next year they will begin distributing software *electronically*. This one change will enable the industry to quadruple itself in under a year's time.

How will software manufacturers manage this miracle?

New software kiosks will soon be popping up in all sorts of places, including department stores, stereo stores, toy stores, computer stores, discount stores, and even 7-11s, drugstores, and videogame arcades. The kiosks will feature computer terminals that are capable of running thousands of piped-in programs on all subjects and for all major computers. A powerful "expert system" will guide the average consumer through the myriad choices and help him decide on his next software purchase.

When the consumer is ready to purchase a program, he will place a disk into a slot on the terminal. He will have purchased the disk for about \$10. A moment later, software for his home computer will be beamed over a telephone link from a mainframe computer to the store's terminal and stored on his disk. He will pay the machine, vending machine style, with a credit card, or make his purchase as he leaves the store. The software itself will cost him only a nominal price—from \$5 to \$10.

The real savings comes to the consumer (and the real meaning of the revolution emerges) the next time he wants to buy a new program. He returns to the kiosk, picks out a new program, and has to pay a total of only \$5 or \$10. The computer

automatically erases his old program from the disk and replaces it with the new program.

Piping in new programs electronically and reducing the cost of individual programs will turn software into an overnight mass-market industry. And software, of course, must be run on computers.

However, when the electronic distribution of software cranks into high gear, computers themselves will quickly sink into obscurity. The computer industry will become like the record industry, with the real focus not on the hardware but on the software.

In the record industry, the focus is on the hot new songs. In the computer industry, the focus will be on the hot new *programs*. Because of their instantaneous, low-cost availability, new programs will be in great demand. The average person will be able to acquire programs almost on a whim, and he or she will be anxiously awaiting all the new programs the moment they come on the market.

A New Synthesis

During 1986 the huge group of computer intimates (people who love to use computers, but don't have the faintest idea how they work) will merge with the much smaller group of computer literates (people who insist on being knowledgeable about

the goings-on under a computer's "hood"). As a result of this merger, the home computer market will again be relatively homogeneous and unified.

At that time both groups will realize that the average person doesn't want to buy a computer "kit." But they will also realize that computers can never become black boxes—like toaster ovens or TVs. No matter how friendly the software, no matter how simple computers are to use, computers will still need to be programmed. Programming is an unavoidable part of computing.

But programming, in 1986, will not be equated with learning BASIC or Logo or Pascal. Instead, it will be a more general-purpose discipline of (goal-oriented, problem-solving, and algorithmic) thinking. And it will be practical and application-oriented.

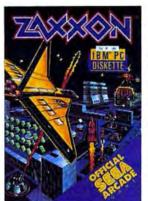

Even when people use a friendly, commercial program, they must do some programming themselves. No matter

how advanced the program, the computer cannot do everything itself. When people use a word processor, they are programming a document. When they use a data base manager, they are programming their electronic file cabinet. When they dial up CompuServe or the Source, they are programming their electronic telephone, post office, newspaper, catalog, or library. Programming can be easy, menu-driven, and done with icons and mice, but it is still programming. Human beings still have to do some of the work.

Computer Builder Kits

We are on the verge of a new generation of computer programming languages—high-level, application-oriented builder kits. In the future, computer literates and intimates alike will use these new languages to "build" their own music, colorful pictures, animated cartoons, robot pets, interactive simulations, computer advisors, and electronic tutors.

With the right software, the computer can be a multipurpose appliance. It is the ultimate "Mr. T": a Toy, a Tool, or a Tutor. But whatever it is, the computer will still need further programming after we bring it into our home. We will have to program it so that we can mold it exactly to our evolving needs and our desires.

You've just experienced Zaxxon by the people who brought you the original arcade version. Sega.

It's available for the first time in cartridge form for the Commodore 64, Atari 5200 and Atari home computers. And on disc for the IBM-PC.

Zaxxon. From Sega. The very best game. From the very best game makers.

A very lethal combination.

Questions Beginners Ask

Tom R Halfhill, Staff Editor

Are you thinking about buying a computer for the first time, but don't know much about computers? Or maybe you just purchased a computer and are still a bit baffled. Each month in this column, COMPUTE! will answer some questions often asked by beginners.

For keeping programs on tape, what's the best kind of cassette recorder I should buy for my computer?

First of all, be sure you have an option in this area. Some computers require a special recorder and are not designed to work with ordinary cassette recorders. Examples are Commodore and Atari computers. The Commodore 64, VIC-20, and PETs require a Datassette recorder; the Atari 400/800 and new XL models require the 410 or 1010 Program Recorder. These special recorders are optimized for data storage and generally cannot be used for any other purpose. For instance, neither the Commodore Datassette nor the Atari Program Recorders have microphones or standard input/output phono jacks. Instead, they have interface cables which plug into a special port on the computer.

Other personal computers are designed to work with any standard cassette recorder. Examples are the Texas Instruments TI-99/4A, Radio Shack TRS-80 computers, the Apple II, IBM PC/PCjr, and Timex/Sinclair computers.

If you have a computer which can work with a standard recorder, check the manuals to see if the manufacturer recommends a certain brand. Sometimes a recommendation means the manufacturer has experimented with different recorders and has found a particular model to be superior. On the other hand, some manufacturers merely recommend a recorder made by an affiliated company. Radio Shack, for instance, advises TRS-80 owners to buy a certain Radio Shack recorder for their computers.

The best way to get a reliable recorder is to try several different models with your computer and decide for yourself. Unfortunately, you probably won't have access to very many recorders, unless you can find a store which will let you return any which don't work well. Perhaps you can borrow cassette recorders from friends for your

tests. Or contact your local users group for advice.

Other than the computer manufacturers' own units, we know of only one recorder specifically made for home computers: the General Electric Computer Program Data Recorder (Model 3-5158A). It looks about the same as any other recorder in its price range (under \$40), and even has a built-in microphone for taping voice or music. However, GE says the unit has a flatter bass response for more reliable data recording. It also has two features you should look for in any recorder to be used with a computer—a tape counter and a tone control. Tape counters are invaluable for locating programs in the middle of tapes, and tone controls can optimize the recorder's output for your computer. With any recorder, you should experiment to find the exact volume and tone settings that work best and then mark them for future reference.

I've tried to take pictures of my computer screen like the ones I've seen in COMPUTE!, but they never come out quite right. What's the best way to do this?

In the first place, you must have a camera which can focus closely enough to fill the viewfinder with the screen. Most inexpensive cameras cannot focus sharply on objects less than three to five feet away. Inexpensive cameras also have semi-wide-angle lenses which make the image appear even smaller, plus separate viewfinders which do not show the actual image as seen by the lens (and therefore the film). At COM-PUTE!, all screen photos are taken with a tripod-mounted 35mm single-lens reflex camera with a 50mm (normal) lens. The camera is positioned so the edges of the screen are just visible at the edges of the viewfinder.

With this setup, only three major problems remain: avoiding reflections, determining proper exposure, and eliminating partial scan lines.

Reflections on the glass video screen are distracting and often show up as "hot spots" in the photograph. Flash pictures, of course, are out of the question. All light for the picture must come from the screen. We avoid reflections by shooting the photos in completely darkened, windowless

KRELL & EDUCATION

CONNECTIONS

Krell's Connections is the most exciting development in educational computing since LOGO. Connections offers children of all ages a new world of entertainment and intellectual challenge. Parents and educators will be gratified by the intriguing yet serious nature of Connections.

Connections is accompanied by an initial set of data bases (included free with the game system) that deal with geography, chemistry, mammals, mathematics, tools, and everyday objects. Connections helps users to build their own data bases and to utilize the data bases created by others via the Connections User Group Exchange Program, 48K.

KRELL'S SAT* PREP SERIES

70 POINT SAT* SCORE INCREASE WARRANTY

42 program series. Complete coverage of all SAT* topics including The Test of Standard Written English. All materials presented in SAT* format and at the same level of difficulty encountered in SAT* Exams. Scoring and explanations provided instantly. Krell's unique logical design customizes this multi-disk set for each individual user. Beware of imitations! \$299.95

Bonus Included: The As & Bs of Academic Scholarships by Robert Leider and Shelly Schwab, 6th Edition.

Available at Selected Dealers

KRELL'S LOGO

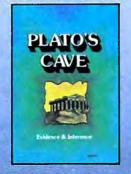

The M.I.T. authorized version. Comprehensive 4-disk set includes two copies of LOGO for Apple II^{1*}, all utility programs and Sprite drivers, all M.I.T. demonstration programs, shape editor, music editor, 21 program Alice in Logoland Tutorial Series, and massive documentation including full color wall chart. THIS IS THE GENUINE ARTICLE! Unlike the version marketed by Apple Corporation, KRELL'S LOGO offers the full package of M.I.T. features including the ability to save pictures.

Spectacular Price \$89.95

TOP RATED IN INFOWORLD EXCELLENT IN ALL CATEGORIES!

New! ALEXANDER THE GREAT

Available at last!!! Alexander The Great is the ultimate game for developing word and arithmetic skills, far better than Scrabble*. Alexander The Great permits equal competition between players at different skill levels. Complete graphics and range of options make Alexander The Great the best and most challenging, educational tool ever devised. Available for all microcomputers and in a board version, 48K.

New! PLATO'S CAVE

Spectacular game for aspiring scientists of all ages. Players probe *Plato's Cave* with light beams as they explore the relation between illusion and reality and the relation between evidence and inference. Graphic, dynamic, and challenging, with difficulty levels suitable for all, 48K.

rooms. At home you'll have to shut off all the lights, pull the window shades and curtains, and close the doors. If this isn't practical, try erecting a blanket "tent" over the camera and screen to block off all outside light.

Unfortunately, darkening the room can complicate the second problem—determining proper exposure. If the camera has a built-in meter, it is fooled by the dark background. We often get around this problem with a handheld light meter, holding it close enough to the screen to make sure it isn't reading anything else. You can do the same thing with your camera's meter, although it means removing the camera from the tripod for each reading. And be sure not to read a completely dark or light screen. Take your readings from medium tones or colors.

The camera must be mounted on a tripod for the exposure because of the very slow shutter speeds required. TV sets and monitors display an image by constantly redrawing it on the screen about every 1/30 second. Theoretically, then, shutter speeds faster than 1/30 second result in a picture with only a partial screen image (the partial image shows up as a dark band across the screen). In practice, we've found that shutter speeds no faster than 1/4 second are necessary to completely eliminate partial scan lines. And that, in turn, means the image must remain motionless for the

duration of the exposure to avoid blurs. We often have to modify programs to freeze them on the screen.

Finally, slow- or medium-speed films are better than fast films. We use Kodak Ektachrome 64 (a color slide film) mainly because it can be custom-processed locally in a few hours. Actually we would prefer Kodachrome or another film with a warmer response to compensate for the strong blues emitted by most video tubes. Our exposures with Ektachrome 64 are usually about 1/2 second at f/16. We bracket one stop each way to insure good results. We also hook up the computer to a regular computer monitor instead of an ordinary TV to get a sharper picture.

dMOS™

Database Management Operating System

The BEST data base management tool for the collection, arrangement and display of alphanumeric data.

A unique pattern matching and searching capabilities make dMOS™ the easiest DB system available on the market.

Features:

- Map search technique to achieve a "logical AND", while searching between fields.
- · Display records found, or NOT found by a search.
- Rearrange fields.
- · Suppress fields and field titles.
- Insert short (10 character) text.
- · Selectively print records.

\$3995

SoftLoc"

The Program Security System

Set up program security in minutes.

Lock up your personal, financial or business records.

3 types of protection:

Re-encodes program.

and announcing. . .

- · Modifies diskette directory.
- Selectable and reassignable 7 digit access code.

\$2995

Missing Key ...

A reset System
Restores your BASIC Program.

After programming for hours you press RUN for a final check of your work — the computer locks up. You press RUN, STOP... nothing — you press RESTORE... nothing — you look for the missing key but it isn't there. You have to turn off your computer and lose hours of work!!

Now Add the Missing Key™:

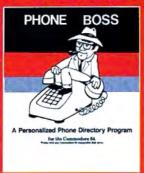

- Press the "Missing Key[™]" and the computer resets itself from any lockup, and your BASIC program is restored.
- Load and run the program included.
- Takes nothing away from your computer, neither memory nor a plug-in port.
- Attaches to your C64 keyboard or any other convenient location.
- Will not void your CBM warranty.

\$2995

Personal Phone Directory Program

Designed to store and organize your personal phone listings.

The user has complete control of 15 category titles and entries.

THE BEGINNER'S PAGE

Richard Mansfield, Senior Editor

A Wall Of Loops

It takes most people a few weeks of part-time study to learn BASIC. Of course defined functions, multidimensional arrays, and other advanced techniques would not yet be understood, but after a short time, a novice programmer can accomplish a good deal with BASIC.

Nevertheless, during those first few weeks, most of us run into a wall—one of the fundamental BASIC commands is simply beyond understanding. Try as we might, some concept thoroughly resists our efforts to learn it. For me, the wall was the ON X GOTO 100,200,300 command. With furrowed brow, I came back to it again and again, trying to sée how X controlled those line numbers following the GOTO.

Simple Loops

Others have said that their wall was nested loops. Let's take a look at these loops within loops. Nested loops are one of the elements of computer power and a beginning programmer must be able to use them.

Here's a simple loop:

Program 1: Simple Looping

	-					
10	FOR I	=	1	TG	100	
20	PRINT	I				
30	NEYT -	_				

The variable I is assigned a range of 1 to 100 in line 10. It is told that it will start out being a 1 and count up to 100 during the FOR-NEXT loop. And any commands between the FOR and the NEXT will be executed *each time* through this loop. In other words, line 20, which prints the current value of I, will be executed 100 times.

Anything else you want done 100 times can be squeezed in between lines 10 and 30 in this program. If you want your name printed 100 times, just put in a line 11 like this:

11 PRINT "MY NAME"

and it, too, will be printed. It's easy to see how this might come in handy when printing labels or addresses on a printer.

Now, to make the actions in Program 1 a bit

clearer, take a look at Program 2:

Program 2: Looping Without FOR-NEXT

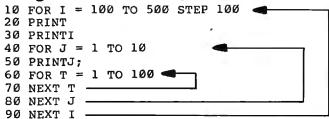

```
10 I = 1
20 PRINT I
30 I = I + 1
40 IF I = 101 THEN END
50 GOTO 20
```

This does exactly the same thing as Program 1, but it's a bit clumsy. As you see, we can create a loop structure without using FOR-NEXT commands, but it takes up more room, takes longer to program, and runs more slowly. It's not generally the best way to set up loops, but it does help to visualize how a loop actually works.

Stuffed And Nested

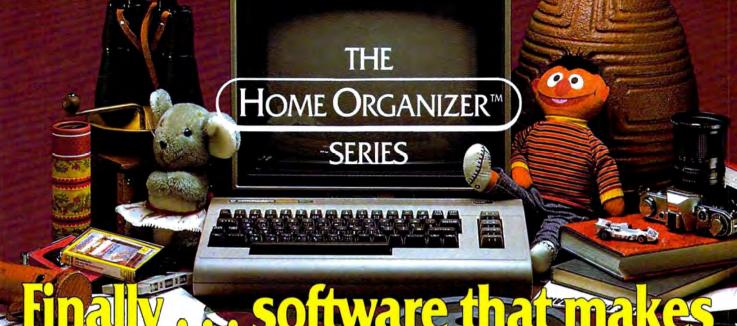

Now we can try stuffing loops inside other loops. This is a technique which amplifies the power of loops. It's called *nesting* and the first FOR (coupled with the last NEXT) is called the *outer loop*:

Program 3: Nested Loops

The outer loop in this program (the FOR in line 10 and the NEXT in line 90) causes the entire program to cycle five times, executing every command in lines 20–80 five times before stopping. As an aside, the STEP command in line 10 is an interesting variation on the simple I = 100 TO 500 command. Without the STEP, this program would execute 500 times. But STEP forces the I variable to add 100 to itself each time we hit the NEXT in line 90. So, instead of a series like 1,2,3,4,5,6,7 ... we get the series 100,200,300,400,500, a total of five cycles through the loop.

In any case, line 20 PRINTs a blank line, line 30 PRINTs the current value of the I variable, and then we come upon the first nested loop. The J

nallyn Software that makes your Commodore 64 feel comfortable at home

Now your home computer can help you cook, keep your accounts, find an address or keep track of your record and book libraries—with first-class software specially tailored for the home environment.

The Home Organizer™ series includes a wide range of separate and individual programs for different activities like stamp collecting, personal banking, or home photo and movie collections. Each one is pre-programmed with a "page" format planned out by experts to make it easy for you to store and retrieve the information you'll want for your special activity. You don't have to program anything yourself. Just load the disk and start feeding in your data.

If you're used to run-of-the-mill home computer software, the speed and simplicity of the Home Organizer™ series will surprise you. Each program is written entirely in "machine language", the most basic computer code. So they search, sort and analyze your data with amazing speed.

The Home Organizer™ is fast enough to sort through your household belongings in seconds, yet so simple the children can use it to look up a phone number. Choose any or all program modules that fit your needs. They make ideal gifts, too!

"Excellence in Software"

For a full color brochure write to:
Batteries Included, 186 Queen Street West, Toronto, Canada M5V 1Z1 (416) 596-1405 / 3303 Harbor Blvd., Costa Mesa, CA. 92626 (714) 979-0920

variable is given a range of 1 to 10, so everything between lines 40–80 will be performed ten times. But since this loop is nested inside the I loop (which creates five cycles of its own), the PRINTJ in line 50 will be executed 5 *times* 10. In other words, the value of J will be printed a total of 50 times in this program.

An even deeper loop, called the *inner loop*, appears between the FOR in line 60 and the NEXT in line 70. This loop is given a range of 1 to 100, but it isn't given anything to do. It just counts up to 100 and then we perform the NEXT J in line 80.

Do-Nothing Timers

That inner T loop does actually accomplish something, however. It uses up time. Such loops are often called *do-nothing loops* or *delay loops*. Their function is to slow down the computer. Sometimes this is very handy. Computers are fast. If you are having something PRINTed to the screen and it's sliding by too fast to read, insert a delay loop and give that loop whatever range suits your reading speed. Then, before allowing the program to proceed, the delay loop will count from the low up to the high number in its range.

Here is a second version of this same program, but, again, the FOR-NEXT commands are not used. If you are still unclear about how Program 3 functions, take a look at Program 4:

Program 4: Nested Loops Without FOR-NEXTs

```
10 I = 100
20 PRINT
30 PRINT I
40 J = 1
50 PRINT J;
60 T = 1
70 T = T + 1
80 IF T < > 100 THEN 70
90 J = J + 1
100 IF J < 11 THEN 50
110 I = I + 100
120 IF I = 600 THEN END
130 GOTO 20
```

Like Program 2, Program 4 is large, clumsy, and slow. For example, it takes five times as long to execute as Program 3, its counterpart. You'll probably never write nested loops like those found in Program 4, but you can take a look at it to see how nested loops are structured.

Program 4 also illustrates various true/false types of loop exits. Line 80 means that we keep on cycling through the loop if the variable T does not yet equal 100. We exit when T = 100. Line 100 continues to cycle as long as J is less than 11. In line 120, we exit the loop (and stop the entire program, via the END command) if I equals 600.

Rules And Customs

There are several programming rules and customs you should try to observe when working with loops. In general, a programmer cannot use the same variable name for different functions or the program might make serious errors. For example, if you are writing a program to figure out your budget and you say TAXES = 15000 (for federal tax) and then use the variable name TAXES again later in the program: TAXES = 400 (meaning state tax), you will have hopelessly confused the computer. You have to use different variable names, such as FED and STATE.

The same thing applies to loops. Each different loop must have its own name FOR I/NEXT I, FOR J/NEXT J, etc. To help keep this straight, most programmers use the variable I for their outer loop, then J, then K, and so on up the alphabet. The letters I, J, K, and L are not used for normal variables, just for loops. Similarly, the variable name T is reserved for timing loops, those delay loops we mentioned above.

Also, every FOR must have a matching NEXT to close its loop, and nested loops must not interweave. You cannot have a structure like this:

10 FOR I = 1 TO 10 20 FOR J = 1 TO 20 30 NEXT I 40 NEXT J

lines 30 and 40 are out of order. The inner loop, the J loop here, must be closed by its NEXT before the I loop can be closed.

Answer: Smith-Corona

Question: What company offers a new daisy wheel printer, three

dot matrix printers and a combination printer-typewriter,

with suggested retail pricing of \$395 to \$795?

Question: What printer company offers print quality that challenges

printers costing hundreds of dollars more?

Question: What printer company offers dual interfaces for all five

of its printer models?

Question: What printer company offers removable and adjustable

tractor feeds as standard equipment on all of its dot

matrix models?

D-100 (TM)

dot matrix printer.

Question: What printer company has a toll-free telephone number

to call if you ever have a problem? And an

D-200 (TM) dot matrix printer.

Computers And Society

David D. Thornburg, Associate Editor

Until this year, the personal computer industry had been moving steadily forward in the quality and utility of the technology made available to the user.

I remember in 1978 when choices were largely limited to Commodore's black-and-white display of characters (no high-resolution graphics), Radio Shack's black-and-white display of capital letters and limited low-resolution graphics, and Apple's color display with low- and high-resolution graphics, but no lowercase letters.

Over the intervening years, new players like Atari created improved computers with superb sound and graphic capabilities, simply because improving the technology was the way to win new customers. This type of advancement rippled through the early computer manufacturers, leading, for example, to computers like the Commodore 64.

Innovation Meant Profits

It was the American Dream in action. If you wanted to compete in the personal computer marketplace, you had to create better technology so the customer got more perceived value for each dollar spent. The customer and the computer manufacturers were clear winners. Each technological advancement sparked new enthusiasm in the marketplace and in the hearts of the designers.

Companies who lacked the vision or the ability to keep in step fell by the wayside, and new companies entered the field knowing they would be judged on technological performance and price. It didn't matter if you were a new company or an old-timer to the industry; the issue was one of performance.

Benjamin Franklin would have been proud.

Enter Big Blue

But then something strange happened. A sleeping giant awoke and entered the personal computer marketplace with a system that would have gathered dust on the shelves had it been created by a small company. Given IBM's newness to the personal computer field, the awkwardness of the PC could perhaps be forgiven.

But, rather than letting IBM take its lumps with the other companies who delivered less than expected, analysts and just about everyone else started jumping on the PC bandwagon. "IBM legitimatizes the small computer market" was a common statement, as though this thriving industry somehow needed IBM's belated blessing to even exist. Many people quickly forgot that this industry was doing just fine, thank you, years before IBM was willing to concede that computers might be owned by individuals rather than by corporations.

Overwhelming Influence

And so, as an industry, we had to live with *fewer* colors, cumbersome peripheral cards, and expense after expense. But, we were told, don't compare the PC to the Commodore 64. The PC is *not* a home computer, it's a computer for *business*. Big, bold, expensive, time-consuming to use—after all, who ever said computing should be fun?

Nonetheless, many software artisans and hardware copyists said, "If IBM does it, it must be right."

Within a short period, IBM work-alike computers were appearing in droves, and almost every software house in the country rushed to produce software for this machine. It made great business sense, and everybody thrived.

Some of us thought that IBM's *home* entry would make up for some of the PC's shortcomings.

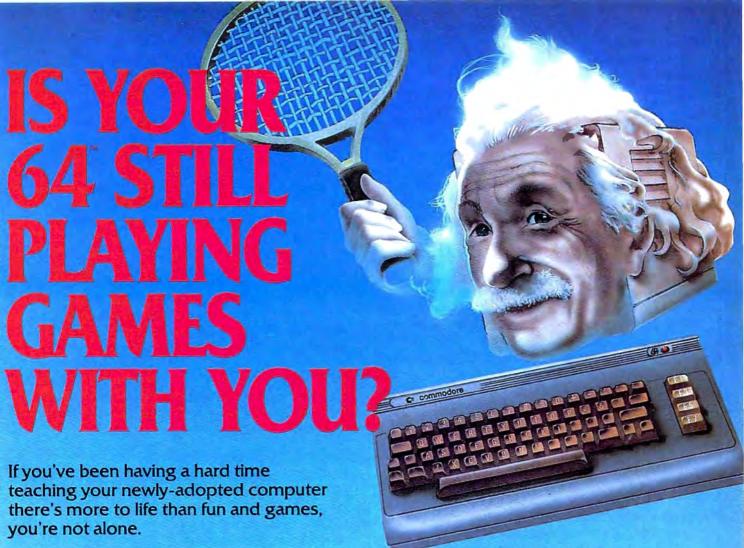

After all, the consumer marketplace had been bombarded with technological marvels for years: Atari had shown us that good colors can be created when you have independent control of hue *and* luminance.

The sound chip capabilities of Atari and Commodore computers took computers out of the beep and click stages and gave us harpsichords and pipe organs instead.

Waiting For Junior

One processor was no longer enough—multiprocessor computers for home use became commonplace. Apple redid the II and produced the crisp and competitively priced IIe. All was right with the home computer world as we eagerly awaited IBM's announcement.

When the long-awaited PCjr was announced, some of us thought that IBM hadn't even looked at the competitive products. Borrowing a page from the past, the PCjr used a bulky external

Now, you can introduce your Commodore 64™ to the Work Force: affordable, easy-touse software and hardware that will unleash the power you always expected from your Commodore 64[™], but thought you might never see.

PaperClip*

is simply the best word processing program of its kind-loaded with advanced features, yet so easy to use even a novice can get professional results. With SpellPack™, it even corrects your spelling! Once you've tried it, you'll never use a typewriter again.

gives you crystal clear 80 column display. Using the highest quality hardware, we've eliminated the problems of snow, fuzziness and interference. Basic 4.0 commands greatly simplify disk drive access. Switches easily from 40 to 80 column display.

Discover the true power of your Commodore 64™. Ask your dealer about the Commodore 64™ Work Force, from Batteries Included—the company that doesn't leave anything out when it comes to making things simple for you.

"Excellence in Software"

These products have been developed specifically for Commodore computers by Batteries Included and are totally compatible with each other. For a full color brochure write to: 186 Queen Street West, Toronto, Canada M5V 1Z1 (416) 596-1405 / 3303 Harbor Blvd., Costa Mesa, CA. 92626 (714) 979-0920

power transformer. Yes, so does Commodore and Atari, but we never liked this external transformer, and IBM had a chance to improve in this area.

Looking at the PCjr overall, it reminds me of the Coleco Adam—a computer system that for under \$700 provides everything you need—software, letter quality daisy wheel printer, etc. The PCjr may have borrowed from Adam's good looks, but the IBM starter system has no mass storage device, no software, no printer, and doesn't even come with a cable to connect the computer to a TV or monitor.

The Controversial Keyboard

Aside from its striking price difference from the Adam, the PCjr does have one other difference: The Adam has a decent typewriter-like keyboard while the PCjr has what we call a "Chiclet keyboard."

Old-time readers might recall that in 1980 I wrote of the TRS-80 Color Computer's keyboard: "I do find the noise from the keyboard to be a bit annoying—somewhat like typing on a plate full of pennies...." The fact is that Chiclet keyboards were poor choices when Radio Shack and TI used them. In the intervening years, Radio Shack and TI switched to full-stroke, typewriter-style keyboards.

To my knowledge, IBM entered the market as the *only* personal computer manufacturer to promote a keyboard design that had been tried and rejected by the customers of several other computer manufacturers.

Once again, almost every trade magazine includes an editorial claiming that "IBM has now made the home computer market legitimate."

Buying The Brand

What is happening to us? Why are we apparently so willing to have our technological expectations sacrificed on the altar of brand-name recognition?

Yes, it is true that companies like Apple haven't been in the computer business as long as IBM, but that doesn't mean that their service is any poorer. Somehow, even though they had no prior experience in this marketplace, IBM had cultivated an image that so excited the computer-buying public that they could have sold *anything* and people would have bought it.

To me it is tragic that, given the history of IBM, they didn't use their entry to establish new standards of excellence, user-friendliness, and sensitivity to the price expectations of the public. Had they done that, the PCjr would have been worth the wait.

Standard Disappointments

If the PCjr is one step backward, it is not alone. When I first heard about the MSX computers, I

was quite pleased. For the first time since the start of this industry, several manufacturers got together to create a standard for everything from disk drives to joysticks.

From the customer's perspective, this was a dream come true. Every time I address the general public, someone asks why they can't run an Apple disk on their Atari computer.

Good question. After all, everybody knows you can play the same phonograph record or video tape on equipment from any number of manufacturers.

So, a standard was a good idea in my mind. The problem with the MSX computers is that the standard was designed around the Z-80A microprocessor. As a result, we are going to see 1970's technology locked into a standard with total disregard to the advancements in 16-bit and 32-bit architectures that are much more powerful. One always expects some tradeoff when several companies share in a joint decision (after all, it is said that a camel is a horse designed by a committee), but this technological back-step seems to be too high a price to pay.

Saved By Competition?

Will the marketplace take care of this problem by itself? After all, consumers have made their desires known in the past. Well, if SONY, Yamaha Hitachi, Mitsubishi, Pioneer, Fujitsu and the others (yes, Virginia, there is an American MSX machine—from Spectravideo) enter our market with a media blitz equal to that used to sell televisions, it will take a lot of resistance to keep from falling in line. In fact, I wouldn't be surprised to see companies like Commodore introduce an MSX computer just to preserve their market share.

But the darkest hour is always just before dawn, and there is a refreshing glimmer that shows an alternative to these two technologically backward steps.

A Bright New Apple

This refreshing one-step-forward is the Apple Macintosh—a computer designed for anyone to use. Macintosh is reasonably priced (\$2500 including display and disk drive and operating system software—IBM, please note). But more important than Macintosh's system price is the almost intuitively simple manner in which it is used.

I maintain that any COMPUTE! reader can master Macintosh in 30 minutes. It is, by far, the easiest computer I have used since I worked at the Xerox Palo Alto Research Center. PARC was the spiritual home of some of the software ideas so masterfully implemented in Macintosh. This computer is designed from the ground up to be responsive to the user's way of doing things, rather than forcing the user to bend to the arbitrary constraints of the

Con any criteria

(* commodore

computer.

To take just one example, suppose you want to edit a letter you have written with the *MacWrite* word processor. Once you have inserted your disk, your screen shows you a set of icons representing the various items stored on the disk, with their names beneath them. These items might be documents, pictures, programs, schedules, etc.

You use the mouse to move the cursor to the

icon representing the document you want to edit, and with a couple of clicks you have automatically loaded the word processor which has automatically loaded the document for you to edit.

Truly Innovative

Macintosh is, quite simply, a civilized machine. After working with it for a while, I found myself quite intolerant of my other computers. The

Counterpoint:

Computers And Society, June 1984

David wrote his first article for me in the first issue of COMPUTE!, Fall 1979. Since then he has been a regular columnist. One of the constants of our working relationship in all these years is that David has been free to share his thoughts—after all, who could ever justify curbing a column called "Computers and Society," especially in 1984?

I have some problems with this particular column of David's. Among our editorial staff here I do not have unanimous support. On the other hand, I'm not alone in my concerns. Thus, David's column is presented here in full; my comments appear below.

Robert C. Lock, Editor In Chief

It would seem that the primary criticism of IBM is their "failure" to introduce personal computing products that are hallmarks of technological innovation. In any maturing industry, there are always leaders, entrepreneurs, bastion stormers who take the risks, blaze the trails, and yes, make several mistakes and fail—or make fewer and survive. I would suggest that IBM passed through that phase in its maturation as a company some decades ago. Right or wrong, such a process is also a part of the American Dream in action.

The Case Is Overstated

To characterize IBM as a sleeping giant, stumbling awake to inflict awkward products on a naive public, is unrealistic. In part, it simply reflects the changing values one frequently encounters in a maturing market. While it may be frustrating that the IBM products don't reflect a state-of-the-art technology, it can also be argued that they reflect a tested, tried, and reliable technology.

Is this a sidestep argument? I don't think so. No more than to argue that IBM computers sell simply because they're IBM computers. Built into that statement is a tradition that's also a reflection of the various levels of maturation of the marketing process. Given appropriate emphasis, the statement can be negative;

given another emphasis, it can be exceptionally positive.

Consumers Trust IBM

I don't think that IBM could have sold "anything," and that people would have bought it. At least not for long. That's not what IBM's all about. Their business is to deliver reliable working products that meet a need in the market.

Have they done that? The demand for their personal computer products would seem to indicate their success. Have they failed to "establish" new standards of excellence? I would disagree. Have they had the design problems, delivery problems, service problems, continually revamped operating systems, bugs and fixes, that have bedeviled less mature companies over the years? Have we seen them "experiment" with the public by quickly, hastily bringing to market a product that's gone in six months—or worse, never delivered? Have we seen them vacillate in and out of the market with promises and visions never to be fulfilled?

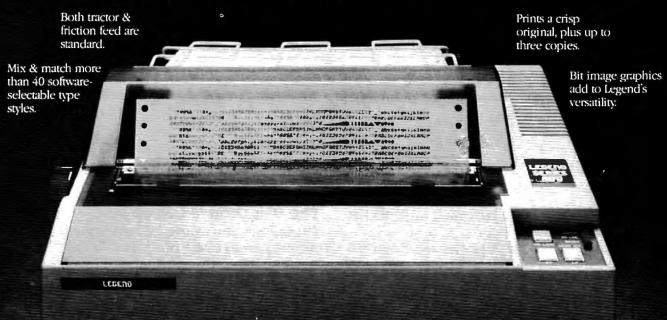

I think not. And I'm not quite sure why all of these "failures" indicate a deviation from their history, or a step backwards for the industry.

Rather than saying "If IBM does it, it must be right," I would argue that "If IBM does it, it will probably be valid." After all of the arguments and questions over the last few years about the true utility of home computers, and the myriad of attempts to expand their usefulness to a broader base of the population, IBM is showing a willingness to take a certain kind of risk. It may not be in the area of sophisticated graphics, or breakthroughs in software, but I would venture to guess that the recently announced joint venture between IBM, Sears, and CBS to develop mutual utilization of home computers will have a chance at making a massive step forward in the ability of our industry to mature as a functional home "utility."

Innovation comes in many guises, not all of them hardware- or software-based.

And David, a p.s.: I agree with you on that strange little keyboard.

The Making Of A Legend.

Centronics parallel interface standard; RS232C optional.

Serial impact dot matrix in two models: 80 & 100 cps. New square dot technology for higher resolution & near letter quality print (Model 800). Up to 142 columns in compressed printing mode.

Toll Free 1-800-321-4484

Bi-directional logic seeking for fast output.

Features like these make our new dot matrix impact printer a Legend. While a low price makes it a near miracle! Imagine, all this and more for less than \$350. That puts you into our 80-cps Legend 800 model. And if you're looking for something even faster, look into our 100-cps Legend 1000.

See them both at a dealer near you. Or drop us a line for facts by mail: CAL-ABCO/PERIPHERALS DIVISION, 14722 Oxnard Street, Van Nuys, CA 91401. Telephone (818) 994-0909. Toll free 1-800-321-4484. Telex 662436. Dealer inquiries invited.

Macintosh is qualitatively distinct from any other personal computer. It has defined a new tier of the market.

This definition had happened *not* because of its 32-bit architecture, its 1 to 2 million instructions-per-second speed, or its price, but simply because of its functionality. For years the industry has been telling us that computers are easy to use. Macintosh finally came out to fulfill that promise.

But will Macintosh be successful? I hope so. Apple appears dedicated to supporting third-party software developers, and several powerful languages are available for users who like to create their own programs.

Back On The Right Track

There is another reason I hope Macintosh is successful. This country was built on the concept that people with good ideas could compete in the open marketplace. This spirit of open competition guaranteed not only that the customer got a good deal, but that technology would improve as newer and better products were developed. If, by pure force of corporate identity, we can be convinced to drop our high standards of cost-effective performance, we can kiss the free enterprise system goodbye.

Macintosh is more than a computer—it is a statement in response to the clearly stated needs of the consumer. How will we respond?

INSIGHT: Atari

Bill Wilkinson

As I write this, I have just returned from the Las Vegas Comdex show.

Comdex stands for "COMputer Dealers' EXposition," but it is really a show for those who would sell to the computer dealers. And sell they did. Everything from magic acts to talking robots to sit-down demonstrations (very welcome after walking through literally acres and acres of booths). And, of course, IBM was there in force, occupying an entire building and demonstrating the usual stuff on the PC and, not surprisingly, some me-too-ish software on the PCjr.

Compatible Disk Drives

The only Atari-compatible hardware products that I saw at Comdex were some disk drives (though I understand that one or two graphics tablets were shown there, also). And that, of course, brings up my next topic.

When you consider the fact that Atari doesn't even make a double-density disk drive, it's more than a little surprising and pleasing to discover the amazing degree of compatibility exhibited by the various non-Atari disk drives.

Since OSS provides the disk operating system (DOS XL) which many of the drive manufacturers supply with (or as an option to) their disks, I can't make judgments as to quality, reliability, etc., without an obvious conflict of interest. I can, however, comment on the features common to all Atari-compatible drives (except those made by Atari itself).

The 815 Drive's Legacy

Historically, the reason for the compatibility is the ill-fated Atari 815 drive. For those of you relatively new to the world of Atari, that was the dual, double-density disk drive announced by Atari for delivery in early 1982. Notice the word "was."

Although never produced in quantity, the 815 survived long enough to cause Atari, Inc., to produce DOS 2.0d ("d" for double), and a few lucky people even have a copy of it. (I'm not lucky.) In fact, even Atari DOS 2.0s can access an 815 style double-density drive for most functions (just don't try to copy files or duplicate disks).

The folks at Percom Data Corporation, though, didn't know the 815 was going to die when they started designing their double-density drives. They did, however, want a way to switch from single to double density without having to physically flick a switch. Hence the configuration block was born. Give Percom credit.

Give the other manufacturers credit, also, for recognizing the Percom system as a viable and usable standard. Would you be surprised to find that the same double-density DOS XL diskette works unchanged in drives or controllers from (in alphabetical order) Amdek, Astra, Concorde, Indus, Micro Mainframe, NCT, Percom, Rana, SPI, and Trak? If you are not surprised, you are not aware of the hodgepodge of the CP/M world.

Each of the companies mentioned can tell you of the advantages of their drives or controllers.

A final comment on the configuration block

scheme mentioned above. A controller capable of implementing all the options of the configuration block can, in theory, support virtually any size disk drive. At Comdex I saw floppy disk drives with densities over a megabyte. Yum.

XL Compatibility

I have received more than a little correspondence from readers asking what they can do about the lack of software compatible with their 1200XL (and, now, the 600XL and 800XL). Up until now, my stock answer has been that they should go beat on the heads of the software manufacturers (the ones who didn't follow Atari's rules).

Now, though, there is a little relief in sight. Atari has, at long last, made available something known as the Atari Translator Disk. This disk, when booted from any 810-compatible drive into any XL machine with 64K of RAM, will (for all practical purposes) turn your XL computer into a non-XL Atari 800. Virtually all software, including protected games and the like, will then boot and run properly. (Of course, you don't turn the power off to boot anymore.)

For those who are stuck with incompatible software, this seems like a neat solution. For those who are stuck with incompatible software and no disk drive, this looks like a frustrating solution. Point of interest: I do believe that this software could be loaded via cartridge instead, since one need not turn off the power to change or remove cartridges on an XL machine. Atari, are you listening?

Anyway, if you need the disk, check with your local authorized Atari dealer. If he doesn't have it, hasn't heard of it, or is nonexistent, try Atari's customer service department.

Reading Binary Files

In March, I presented a short program in Atari BASIC which would read a binary object file directly into the memory locations it was originally assembled for (or saved from).

This month, I will start to parallel that listing in machine language. Please understand that this may not be the fastest or easiest way to perform the task. I use the BASIC parallel method as a way of making the program understandable to those who are just beginning to learn machine language.

As a first step, you might look through the listing, noting where the BASIC line equivalents are. They are easy to find. Starting at line 1000, any line number ending in 00 is a comment line which reflects the line in the BASIC program which I presented last month. Note, also, that the line numbers in this listing are 10 times the BASIC line numbers (simply for convenience and readability).

While examining the listing, you probably noted that there seems to be more nonparallel

code than otherwise. In truth, this simple pseudo-BASIC program does indeed require a fairly substantial amount of support. The support is in two forms: definitions of variables (including buffers) and I/O subroutines.

A Page 6 Assembly

You may also have noticed that I assembled the listing in the infamous page 6 memory block. I plead guilty. Actually, in testing this program, I assembled it twice: once at \$600, as shown, and once at \$6000 (just by changing line 110). I then used the \$600 version to read in the \$6000 version, and it worked!

Anyway, since I will be giving you complete source code here, I don't feel too guilty. Obviously, you can change line 110 to anything you wish if you need to stay out of page 6.

There are two other "cheats" in this listing. In line 220, I place NAME at location \$580; and, in lines 250 and 270, I place START and ADDR at location \$CE. Are these locations truly safe to use? In general, no. If you have been reading my series on self-relocatable code, you know that there are no truly safe locations. But for the purposes of this demonstration, I think we can use them as is, since they are compatible with usage by the Atari Assembler Editor (and MAC/65 and—I believe—AMAC) and Atari BASIC (and BASIC XL but not Microsoft BASIC).

One other comment before we begin analyzing the operation of the listed code. If you wish to use this program as a callable USR routine from Atari BASIC, you need to add this line:

125 PLA; clean up stack for BASIC

BASIC And ML Compared

Now, onward and downward, into the depths of machine language. I will discuss the lines which I feel are relevant and important by line number.

Line 130. We could have accomplished the same thing by giving a RUN address at the end of the listing, but this gets us started in a visible way.

Line 210. Note the use of the \$9B (an ATASCII RETURN code) to terminate the message. The 0 is for safety and because I am paranoid.

Double Usage

Lines 230, 240, 260. If you consider LOW and HIGH together, they form a 16-bit word. Since QUIT needs to be a word, why not join usage? This is not recommended procedure, but it works if you are careful.

Lines 250, 270. This isn't surprising if you think about the fact that line 310 in the BASIC code could have been written as FOR START = START TO QUIT, thus eliminating the need for the extra variable, ADDR.

Lines 300–321. These are the same equates you have seen many places, including in the Atari

June 1984 COMPUTE! 97

OS listings and *Inside Atari DOS* though the actual mnemonics may differ slightly.

Lines 550–566. When you get to this routine, it expects the OS channel designator (which is 16 times the Atari BASIC file number) in the X register, the command value in the A register, and the address of the buffer to use in the Y register (low byte) and on the stack (high byte). The routine assumes that you will not be doing I/O which requires over 255 bytes of buffer (a valid assumption for this program, but not for all circumstances).

Checking For Errors

CMDJOIN sets up the appropriate IOCB and calls

CIO to do the real work. It returns the error status to the user in A, Y, and the flags. In this program, only OPEN looks for the error status. (Because PRINT and INPUT to/from channel zero had better work, and if CLOSE fails it's too late anyhow.)

Lines 500–545. These are the various I/O entry points. Note that they expect the X and Y registers set up as in CMDJOIN. They assume that the high byte of the buffer address is in A and push it on the stack to make room for the command byte. They are simple and effective.

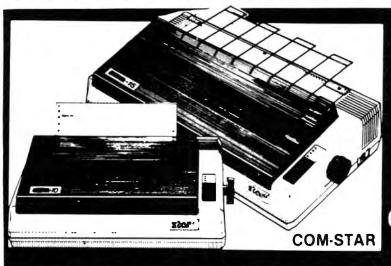

Next month we'll look at the rest of this listing.

Load A Binary Object File

80 COLUMN PRINTER SALE—\$149.00*

COM-STAR T/F

Tractor Friction Printer

only \$199*

•15 Day Free Trial -180 Day Immediate Replacement Warranty

- Lowest Priced, Best Quality, Tractor-Friction Printers in the U.S.A.
- Fast 80-120-160 Characters Per Second 40, 46, 66, 80, 96, 132 Characters Per Line Spacing
 - Word Processing Print Labels, Letters, Graphs and Tables List Your Programs
- Print Out Data from Modern Services
 "The Most Important Accessory for Your Computer"

*STX-80 COLUMN PRINTER—\$149.00

Prints full 80 columns. Super silent operation, 60 CPS, prints Hi-resolution graphics and block graphics, expanded character set, exceptionally clear characters, fantastic print quality, uses inexpensive thermal paper! Best thermal printer in the U.S.A.! (Centronics Parallel Interface).

**DELUXE COMSTAR T/F 80 CPS PRINTER—\$199.00

The COMSTAR T/F (Tractor Friction) PRINTER is exceptionally versatile. It prints 8%" x 11" standard size single sheet stationary or continuous feed computer paper. Bi-directional, impact dot matrix, 80 CPS, 224 characters. (Centronics Parallel Interface).

Premium Quality—120 CPS COMSTAR T/F SUPER-10X PRINTER—\$289.00

COMSTAR T/F (Tractor Friction) SUPER-10X PRINTER gives you all the features of the COMSTAR T/F PRINTER plus a 10" carriage, 120 CPS, 9 x 9 dot matrix with double strike capability for 18 x 18 dot matrix (near letter quality), high resolution bit image (120 x 144 dot matrix), underlining, back spacing, left and right margin settings, true lower decenders with super and subscripts, prints standard, italic, block graphics and special characters, plus 2K of user definable characters! The COMSTAR T/F SUPER-10X PRINTER was Rated No. 1 by "Popular Science Magazine." It gives you print quality and features found on printers costing twice as much!! (Centronics Parallel Interface) (Better than Epson FX 80).

Premium Quality—120 CPS COMSTAR T/F SUPER-15%" PRINTER—\$379.00

COMSTAR T/F SUPER 15%" PRINTER has all the features of the COMSTAR T/F SUPER-10X PRINTER plus a 15%" carriage and more powerful electronics components to handle large ledger business forms! (Better than Epson FX 100)

Superior Quality SUPER HIGH SPEED—160 CPS COMSTAR T/F 10" PRINTER—\$489.00

SUPER HIGH SPEED COMSTAR T/F (Tractor Friction) PRINTER has all the features of the COMSTAR SUPER-10X PRINTER plus SUPER HIGH SPEED PRINTING—160 CPS, 100% duty cycle, 8K buffer, diverse character fonts, special symbols and true decenders, vertical and horizontal tabs. RED HOT BUSINESS PRINTER at an unbelievable low price!! (Serial or Centronics Parallel Interface)

Superior Quality SUPER HIGH SPEED—160 CPS COMSTAR T/F 15%" PRINTER—\$579.00

SUPER HIGH SPEED COMSTAR T/F 15%" PRINTER has all the features of the SUPER HIGH SPEED COMSTAR T/F 10" PRINTER plus a 15%" carriage and more powerful electronics to handle larger ledger business forms! Exclusive bottom paper feed!!

PARALLEL INTERFACES

For VIC-20 and COM-64—\$49.00
For All Apple Computers—\$79.00
NOTE: Other printer interfaces are available at computer stores!

Double Immediate Replacement Warranty

We have doubled the normal 90 day warranty to 180 days. Therefore if your printer fails within "180 days" from the date of purchase you simply send your printer to us via United Parcel Service, prepaid. We will IMMEDIATELY send you a replacement printer at no charge, prepaid. This warranty, once again, proves that WE LOVE OUR CUSTOMERS!

Add \$17.50 for shipping, handling and insurance. WE DO NOT EXPORT TO OTHER COUNTRIES EXCEPT CANADA

Enclose Cashiers Check, Money Order or Personal Check. Allow 14 days for delivery, 2 to 7 days for phone orders, 1 day express mail! Canada orders must be in U.S. dollars. VISA — MASTER CARD ACCEPTED. We

64 EXPLORER

Larry Isaacs

This month we'll take a look at part of a disassembly of the machine language drawing routines which were presented last month. For those who are learning 6502 machine language programming, there are a few items you may find interesting in the source listing for these routines. First of all, if you are new to interfacing machine language routines to BASIC, you can refer to the GETINT subroutine. This subroutine will evaluate an integer expression and return the resulting value. Typically, a machine language routine will need only integer arguments, assuming it needs arguments at all. One potential problem with using a routine like GETINT is that the integer is signed. Integer values greater than 32767 would have to be entered as <value> -65536 before they could be fetched by this routine.

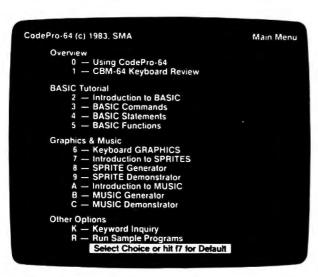

Another thing you might note is how a multiplication by 320 was accomplished in the PIXADR subroutine. The code is based on the fact that multiplication and division by powers of two can be done with left and right shifts of the binary number in question. By converting the expression (320*Y) to (256*Y+64*Y), the multiplication can be carried out by simple shifting. Multiplying by 256 is done by taking the one-byte Y value and storing it as the high byte of a two-byte number. The low byte would be set to zero. The term 64*Y was obtained by dividing the 256*Y term by 4 (that is, two right shifts). Adding the two terms together gives 320*Y.

I hope the comments in the source code provide enough information to understand what the program is doing. If you have an assembler at your disposal, you are certainly welcome to use any of the routines here for your own experiments.

A new concept in interactive visual learning.

CodePro-64™

Now you can learn to code in BASIC and develop advanced programming skills with graphics, sprites and music—visually. You learn by interacting with CodePro-64, a new concept in interactive visual learning.

SEE PROGRAM EXECUTION

Imagine actually seeing BASIC statements execute. CodePro-64 guides you through structured examples of BASIC program segments. You enter the requested data or let CodePro-64 do the typing for you. (It will not let you make a mistake.)

You step through and actually see the execution of sample program statements by simply pressing the space bar. CodePro-64 does the rest. You see statements with corresponding *graphics* and variable value displays.

EXTENSIVE TUTORIAL

CodePro-64's extensive tutorial guides you through each BASIC command, program statement, and function. You get clear explanations. Where appropriate, you invoke BasicView to see examples execute and watch their flow charts and variables change.

By seeing graphic displays of program segment execution you learn by visual example. You learn faster and grasp programming concepts easier with CodePro-64 because you immediately see the results of your input.

You control your learning. You can go through the tutorial sequentially, or return to the main menu and select different topics, or *use keywords* to select language elements to study. You can page back and forth between screens within a topic at the touch of a function key.

Once you have practiced and mastered the BASIC language elements you move on to

more advanced concepts. You learn about sprite and music programming.

SPRITE GENERATOR & DEMONSTRATOR

CodePro-64's sprite generator lets you define your own sprites on the screen. You learn how to define sprites and what data values correspond to your sprite definitions. (You can then save your sprite data to a diskette file for use in your own programs.) You can easily experiment with different definitions and make changes to immediately see the effects.

We also help you learn to program with sprites by giving you a *sprite demonstrator* so you can see the effect of changing register values. You can experiment by moving your sprite around in a screen segment, change its color and see the effects of your changes. You learn by visual examples.

MUSIC GENERATOR & DEMONSTRATOR

Our Music Generator and Music Demonstrator will provide hours of instruction and creative enjoyment. From the beginning of your instruction you can compose simple tunes on the screen using the generator. Once you've completed a composition you can save the tune and its associated SID parameters to a diskette file. Our music sam-

OUR GUARANTEE

We guarantee your satisfaction. You must be satisfied with CodePro-64 for the Commodore-64. Try it for 10 days and if for any reason you are not satisfied return it to us (undamaged) for a full refund. No risk.

ple program can be used alone or incorporated into your own programs to read the saved music file and replay your songs.

Our music demonstrator lets you experiment with various combinations of music programming parameters and hear the results. All you do is enter rows of SID parameters on the screen to create a particular sound. Then you hear each sound by playing the "keyboard organ" in real time as you shift from row to row of SID parameters. By seeing your input and hearing the result you quickly learn how to create new musical sounds and special sound effects.

Whether you're a beginning programmer or an experienced professional, CodePro-64 will help you improve you Commodore 64 programming skills. We're sure because CodePro-64 was developed by a team of two professionals with over 25 years of software development experience.

CodePro-64 is a professional quality educational program for the serious student of personal computing. And it's fully guaranteed. Order yours today.

HOW TO ORDER

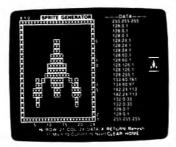

Order your copy of CodePro-64 today by mail or phone. Send only \$59.95 plus \$3.00 shipping and handling to:

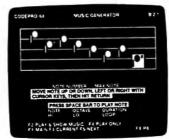

systems management associates 3700 Computer Drive, Dept. G-1 Raleigh, N.C. 27609

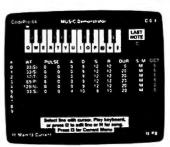

Available on diskette only. MasterCard/-VISA accepted. For faster service on credit card orders, call toll free 1-800 SMA-RUSH. (1-800-762-7874). Dealer inquiries invited.

Jim Butterfield, Associate Editor

A Program Critique — Part 3

This month we continue with comments on Bud Rasmussen's program to copy files on the Commodore 64 with a single disk unit. The program has so far read into RAM memory a file specified by the user.

In this session, we'll track the routine that writes the file to a new disk.

```
START OUTPUT PHASE
C2F7 20 E4 FF SOP
                                 ;GET CHARACTER
                     ISR GETIN
C2FA F0 FB
                     BEO SOP
                                  ; IF NONE, TRY
                                   AGAIN
C2FC C9 0D
                     CMP #RK
                                  ; IS THIS
                                  ; RETURN KEY
C2FE F0 01
                     BEO POPM
C300 00
                     BRK
                                  ; IF NOT, BRK
```

Wait for the RETURN key. If any other key is received, the program will break to the machine language monitor (if there is one). This has a possible problem: Keyboard bounce could cause a halt here. I'd prefer something like this:

```
JSR GETIN ; clear input .
LOOP JSR GETIN ; get character ; if not RETURN...
BNE LOOP ; go back and wait
```

As mentioned before, a BRK (Break) is to be avoided since users won't understand what it means.

Output Phase Begun

Next, we arrange to print an advice message:

C301	A2	23		POPM	LDX	#OPBML	:PRINT
C303	A0	C3					; OUTPUT
C305	Α9	18			LDA	# <opbm< td=""><td>;PHASE BEGUN'</td></opbm<>	;PHASE BEGUN'
C307	20	75	C1		JSR		;MSG
				:	-		
C30A	A9	00		•	LDA	#0	;CLEAR
C30C	8D	62	03		STA	OSF	;OUTPUT STATUS
							FLAG.
C30F	8D	63	03		STA	OEC	;OUTPUT ERROR
							CODE
				:			

Again, clearing these flags may be overkill. They will take care of themselves.

The new disk is initialized. A wise precaution, in case the new disk happens to have the same ID as the old one.

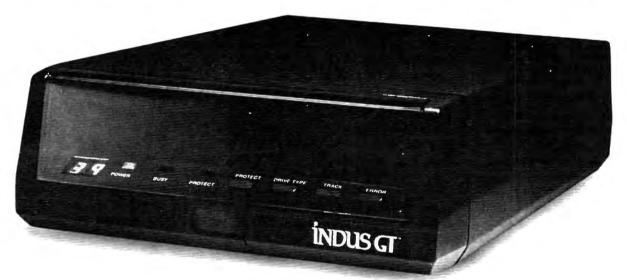

Now we will go through the same routine which was used for input. The main difference is that this time, the name of the file is four characters longer, since ",S,W" is added to make this a write file

```

Check The Disk Status

As previously noted, checking location \$90, IOS—the BASIC ST variable—isn't enough to insure that the file is properly opened. You must call in the disk status over the command channel. There could be many problems in opening a file for writing: A file of that name may already exist, the disk may have the write-protect tab in place, the disk may be unformatted, or the disk might be full, to name just a few. Location \$90 won't tell you about such things.

Looks like a Ferrari. Drives like a Rolls. Parks like a Beetle.

Ask your computer dealer to take the cover off a world-class disk drive. The all new, 1984 Indus GT.™

The most advanced, most handsome disk drive in the world.

A flick of its power switch can turn an Atari into a Ferrari.

Or an Apple into a Red Hot Apple.

Looks like a Ferrari.

The Indus GT is only 2.65" high. But under its front-loading front end is slimline engineering with a distinctive European-Gran flair.

Touch its LED-lit CommandPost™ function control AccuTouch™ buttons. Marvel at how responsive it makes every Atari or Apple home computer.

Drives like a Rolls.

Nestled into its soundproofed chassis is the quietest and most powerful disk drive power system money can buy. At top speed, it's virtually unhearable. Whisper quiet.

Flat out, the GT will drive your Atari track-totrack 0-39 in less than one second. Increasing data transfer 400%. (Faster than any other drive. And as fast as any Apple disk drive.)

And each GT comes with the exclusive CT DrivingSystem™ of software programs.* World-class word processing is a breeze with the GT Estate WordProcessor.™ And your dealer will describe the two additional programs that allow GT owners to accelerate their computer driving skills. *Included as standard equipment.

Also, the 1984 Indus GT is covered with the GT PortaCase.™ A stylish case that conveniently doubles as a 80-disk storage file.

Parks like a Beetle.

The GT's small, sleek, condensed size makes it easy to park.

And its low price makes it easy to buy. \$449 for Atari. \$329 for Apple.

So see and test drive the incredible new 1984

Indus GT at your nearest computer dealer soon. The drive will be

well worth it.

The all-new 1984 Indus GT Disk Drive.

The most advanced, most handsome disk drive in the world.

OPEN CHANNEL (OUTPUT) OCO LDX #3 ;OPEN C360 A2 03 C362 20 C9 FF JSR CHKOUT; CHANNEL 3 C365 A5 90 LDA IOS ;TEST C367 FO OB **BEO SOB** :STATUS C369 8D 62 03 STA OSF ;STORESTATUS ;SET/STORE C36C A9 02 LDA #2 8D 63 03 STA OEC ; ERROR CODE **C36E** C371 4C C5 C3 IMP OE ;OUTPUT ERROR

As during the reading phase, I'd rather the comments said, "connect channel" rather than "open channel." The word "open" has special significance for a file; we have already performed the open activity with our call to OPEN (\$FFC0).

SET OUTPUT BUFFER C374 A0 00 SOB LDY #0 :BUFFER INDEX = 0 C376 A9 00 LDA #0 ; LOAD BFR C378 85 FB STA BAL ; ADDR LO C37A AD 3D C4 LDA SP ; LOAD BFR C37D 85 FC STA BAH ; ADDR HI

It May Miss The Address

You may recall that the input section of the program might under some circumstances change the memory start address, moving it down by 4K. If so, this part of the program would miss the changed address completely. Oops.

; OUTPUT LOOP ; ; C37F B1 FB OL LDA (BAL),Y ;GET CHAR C381 20 D2 FF JSR CHROUT ;PUT CHAR

Output has been switched to logical channel 3; instead of printing to the screen, JSR \$FFD2 sends to the file.

C384	A5	90			LDA	IOS	;TEST

C38D	8D	63	03		STA	OEC	; ERROR CODE
C390	4C	C5	C3		JMP	OE	;OUTPUTERROR
				;			
				;			
				; IN	CR BL	IFFER AD	DR
				;			
C393				IBA	=	*	
C393	E6	FB			INC	BAL	; INCR BFR ADDR LO
C395	D0	02			BNE	CEA	; IF NOT 0, CHK END
							AD
C397	E6	FC			INC	BAH	; INCR BFR ADDR HI
				;			
				; CC	MPA	RE END A	DDRESS
				;			
C399	A5			CEA		BAH	;LOAD BFR ADDR HI
C39B	C5	FE			CMP	EAH	;BAH VS END ADDR
							HI
C39D	90	E0			BCC		; IF LO, CARRY ON
C39F	A 5	FB			LDA	BAL	; LOAD BFR ADDR LO
C3A1	C5	FD			CMP	EAL	; BAL VS END ADDR
							LO
C3A3	90	DA			BCC	OL	; IF LO, CARRY ON

After a comparison, BCC may be taken to mean "Branch if less." Thus, we'll branch back to OL, the output loop, if the high byte of the write address is less than that of the end address, or failing that, if the low byte is less. In this case, BNE (Branch not Equal) would do the job equally well.

Disconnecting The Channel

Next, the program closes the file since all bytes have been written. But there's an omission: Before closing the file, we should disconnect the output channel from it with JSR \$FFCC. I wonder if this was overlooked because of the confusing use of the term *open*, earlier?

At this point, before closing the file, I would recommend looking at the command channel for any possible disk error message that might have been created during the write. The disk could become full as we write the program, for example.

Good sequence. Always close the command channel last of all, since closing the command channel automatically causes all outstanding disk files to be closed.

```
C3AF 20 E7 FF JSR CLALL ;CLOSE ALL FILES
```

Not needed, if the output is properly disconnected with JSR \$FFCC before closing logical file 3.

C3B2	A2	71		LDX	#FCML	;PRINT
C3B4	A0	C3		LDY	#>FCM	;'FILE
C3B6	A9	CC		LDA	# <fcm< td=""><td>COPIED'</td></fcm<>	COPIED'
C3B8	20	75	C1	JSR	PR	;MSG

As the program usually does, a message is neatly printed, telling the user what's going on.

C3BB C3BE			FF	FG		GETIN FG	;GET CHARACTER ;IF NONE, TRY
							AGAIN
C3C0	C9	OD			CMP	#RK	; IS THIS
C3C2	F0	05			BEQ	TA	; RETURN KEY
C3C4	00				BRK		; IF NOT, BRK

Use RTS Instead Of BRK

See the previous comment on waiting for a key to be pressed. When the program is finished, it should terminate with a BRK (Break) command only if it was invoked from the machine language monitor with a .G (Go) command. Otherwise, an RTS (ReTurn from Subroutine) will return control to BASIC.

```
; OUTPUT ERROR
;
;
C3C5 20 E7 FF OE JSR CLALL ;CLOSE ALL FILES
```

C3C8 00 BRK

Once again: Errors could be worked through in more detail. A BRK to the machine language monitor is not always explanatory.

```
; TRY AGAIN
;
C3C9 4C 00 C0 TA JMP CS
```

To do another file, we go back to the beginning of the program.

```
FILE COPIED MESSAGE
C3CC 12

                     .BYTE$0D,$0D
C43D
               FCML = *-FCM
```

RAM Limits Are Set

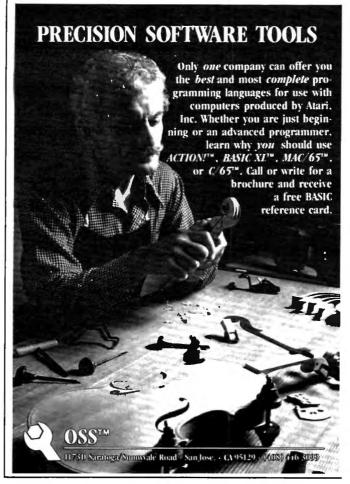

Here are the limits of RAM for the program: They are arbitrarily set to allow space from \$4000 to \$7F00. I'm not sure why, but it's all right with me.

```
C43D 40 SP .BYTE$40 ;START GOREM C43E 7F EP .BYTE$7F ;END GOREM
```

The following sequence is intended to initialize the disk. It does it in an unsatisfactory way: It opens the command channel again. (We have already opened the command channel as logical file 15.) The following code sends the BASIC equivalent of OPEN 1,8,15,"I":CLOSE 1. In a moment, I'll give a preferred approach.

```
INIT DISK
C43F A9 01
               ID
                     LDA #INL
C441 A0 C4
                     LDY #>IN
C443
     A2 5D
                     LDX #<IN
C445 20 BD FF
                     JSR SETNAM
C448 A9 01
                     LDA #1
C44A A2 08
                     LDX #8
C44C A0 OF
                     LDY #15
C44E 20 BA FF
                     JSR SETLFS
                     JSR OPEN
C451 20 C0 FF
C454
     20
        CC FF
                     JSR
                         CLRCHN
    A9 01
C457
                     LDA #1
C459 20 C3 FF
                     JSR CLOSE
C45C 60
                     RTS
C45D 49
               IN
                     .ASC "I"
C45E
               INL
```

What we should be doing is the BASIC equivalent of PRINT#15, "I", which is much easier:

ID LDX #15 ; LF 15, command channel

JSR \$FFC9 ; ... connect to it

LDA #"I" ; Letter I

JSR \$FFD2 ; ... send it

JSR \$FFCC ; disconnect channel

RTS

Error Checking Needs Work

That's the program. It works reasonably well as given. The major improvements I would suggest are additional checking of the disk status (in the program given, the command channel was opened but never used); improved error message procedures; and a little rethinking of the RAM memory allocated.

The program has outstandingly clean documentation; it's a pleasure to read. In the same vein, the messages to the user are good and quite supportive. The coding approach is good, almost classical, in its methodical use of Kernal subroutines. There's a lot to be learned from what's in the program, as well as from what's missing.

I'd like to thank Bud Rasmussen for allowing me to subject his program to analysis, warts and all. It can be embarrassing to have your mistakes—or your style—exposed to public view. I chose to pick through the program in detail because it was well-planned and well-written. Its faults are minor compared to its virtues.

PROGRAMMING THE TI

C. Regena

TI Graphics

Drawing graphics is one of the things that really make our TI computers fun. Chapter 5 of the *Beginning BASIC* book that comes with your computer tells how you can get going with graphics. Using high-resolution graphics allows you to define your own characters and make detailed drawings on the screen. We can combine high-resolution graphics with text on the same screen, and we can use all 16 colors in high-resolution graphics if we wish.

There are several ways to define the graphics characters; this month we'll look at the most common ways. The CALL CHAR statement defines a certain character number with a certain pattern. If you use a number from 32 to 127, the regular symbol or letter will be redefined.

```
110 CALL CHAR(131, "3838107C10284282")
```

defines character number 131. Notice that the character definition pattern needs to be in quotes.

Using CALL CHAR

Another method is to define a string variable first, then use the CALL CHAR. This can save typing if you have several characters defined with the same shape:

```
150 A$="3838107C10284282"
160 CALL CHAR(128,A$)
170 CALL CHAR(136,A$)
```

If you have a lot of character definitions, DATA statements use less memory than many CALL CHAR statements. The disadvantage is that DATA statements are more difficult to type (and debug). This is an example:

```
200 FOR I=1 TO 10

210 READ C,C$

220 CALL CHAR(C,C$)

230 NEXT I

240 DATA 128,3838107C10284282,129,F

FFF,130,FFFFFFFFFFFFFFFF,136,83

E22618186447C1,141,204040808010

102,142
```

```
25Ø DATA 20404080808C936,143,FFFF,1
44,01020408,145,0,151,FF
```

This loop defines ten characters, but instead of ten CALL CHAR statements, there are only six statements. This method is even more efficient when more graphics characters are defined. Within the loop, line 210 reads two values from the DATA statement (C and C\$). Line 220 uses these two values to define character number C with definition C\$.

If all your characters are in numerical order, you can use the character number as the loop counter. The DATA statements then contain only the definitions.

```
200 FOR C=97 TO 127
210 READ C$
220 CALL CHAR(C,C$)
230 NEXT C
240 DATA FFFF,,3838107C10284282,E0C
8 (etc. for all the definitions
```

Zeros Are Assumed

You can define a character with 16 numbers or letters (up to F). If you use fewer, the computer will automatically assume zeros for the rest of the definition. For example, FFFF really means FFFF0000000000000. If you want to save memory and typing, arrange your graphics so the zeros are toward the bottom of the square defined. In other words, 0000FFFF00000000 and 00000000000FFFF and FFFF all look the same, but FFFF is the easiest to use. (The "bar" is positioned in different places in the graphics square.)

A character defined as null will be a blank square, or a square of the background color:

```
300 CALL CHAR(130,"")
```

In the DATA statement method, you can have commas with nothing between them:

```
310 DATA FFFF, FØF
```

The middle definition is null. Both commas are

vital. This particular DATA statement contains three definition strings.

Likely Errors

I mentioned that the data method of defining characters is more difficult to debug. If there is a problem, the most likely message is

BAD VALUE IN 220

You could also get the message

DATA ERROR IN 210

or

OUT OF DATA IN 210

Usually the typing in lines 210 and 220 is fine—the typing error is in the DATA statements. The DATA error messages occur if you don't have the commas placed correctly or if you're reading a string when it should be a number. The BAD VALUE message occurs because the program cannot define the character with what you have read in as data.

The easiest way to find the error is to RUN the program, then when it stops with the error message, print the variables involved. In this case PRINT C,C\$ and press ENTER to see what values we have for those variables. You should be able to see exactly what is wrong with your variables. C will tell you how far in the loop you got. Perhaps C\$ will have the letter O instead of the number zero, or maybe you've typed a period instead of a comma. In any case, you should be able to spot that error among your DATA statements so it can be corrected.

The CALL CHAR statement only defines the graphics character; you need to put the character on the screen using CALL HCHAR, CALL VCHAR, or PRINT. If a character is already on the screen and you use CALL CHAR to redefine it, all the characters on the screen with that character number will instantly change.

Changes On The Screen

Here's an example of changing character definitions while something is on the screen. Type this short program in, then RUN it.

```
100 PRINT "ABCDABCD"
```

The screen turns green when the program starts to run, and ABCDABCD is printed on the screen. After a delay loop, line 130 redefines character 65, which is the letter A. All the A's on the screen change. After another delay, the program ends. This technique might be useful to you in game situations when you want to change the graphics quickly.

I use a similar principle to PRINT graphics a

little more quickly than using CALL HCHAR or CALL VCHAR (as long as you don't have to worry about scrolling). Redefine as graphics the characters 96 through 126. Now, instead of using several CALL HCHAR statements to put the graphics on the screen, use PRINT with the lowercase letters. Suppose you have a snake defined in six graphics characters, 97 to 102. You can use PRINT "abcdef" to draw the snake on the screen.

Using Lowercase Letters

Release the ALPHA LOCK key to type the lowercase letters (which are actually small capital letters). Use FCTN and the key to type any symbol on the fronts of the keys. The reason you can use characters 96 through 126 so often in programs is that you may rarely need the symbols or lowercase letters in the text within a program.

To use characters from 129 to 159 in this PRINT method, look at the CONTROL KEY CODES list on your Reference Card (or in the Appendix of the *User's Reference Guide*). You can still PRINT graphics and in the quotes use the control key and the appropriate letter for the character number you want. You'll see either a blank or a funny graphics character as you're typing, but it will work fine in the program.

Every so often I read an article complaining that the TI does not have the capability to print graphics using built-in graphics characters or character strings. My rebuttal is that we do have the means to PRINT graphics, but we are not limited to graphics shown on the keys (such as on VIC-20, MC-10, or Timex graphics keys). We can define high-resolution graphics any way we wish, then PRINT the graphics using either lowercase letters, symbols, control characters, or CHR\$.

Changes For The TI-99/4

A special note to TI-99/4 (square-keyed console) owners: You cannot type in listings using lowercase letters, but a program typed on the TI-99/4A will work on the TI-99/4. If you don't have access to the 4A console, you can convert the PRINT statements by using the ASCII codes of the lowercase letters. 96 is `(grave), then the lowercase letters start with 97 and go to 122. Instead of PRINT "abcdef", you can use

PRINT CHR\$(97)&CHR\$(98)&CHR\$(99)&CHR\$(100) &CHR\$(101)&CHR\$(102)

You may use either the ampersand (&) or semicolons between the character numbers.

Our characters are grouped by eights into character sets which are used in defining colors. We use the CALL COLOR statement to define foreground and background colors for a particular character set—then all characters in that set will be the specified colors. If you need lots of colors on the screen, use different character sets.

¹¹⁰ FOR DELAY=1 TO 400

Commodore Information Handyman

F. Joseph Walker

"Information Handyman" demonstrates some practical uses of data files, and includes a program to keep track of your checking account. Originally written for the VIC with Datassette, the program can also be used on the Commodore 64 and PET/CBM, and can be modified for use with disk.

When data is needed during a program, it is often input from the keyboard or read from DATA statements within the program. Such data is program-dependent, part of the program itself, and therefore not available to other programs. But programs can also use data stored in files. A data file contains information, alphabetic or numeric, that is completely separate from a program. (It's program-independent.) Programindependent files make it possible to share information among several different programs.

Let's say you have computerized your Christmas card list and put the information into a data file. The file contains the names, addresses, cities, states, and zip codes of individuals to whom you will send cards. You can create various programs to manipulate the same information in different ways. For example, you could write one program to sort the names alphabetically, another program to sort by state or zip code, and still another program to search for the mailing information when given a name. You could write an editing program to add, change, or delete names from the list.

Creating A Data File

Let's look at how a data file is created. The general steps are:

- 1. OPEN a file for data entry.
- **2.** Collect the information to be stored in the file.
- Write the data to the file.
- CLOSE the file.

"Information Handyman" illustrates this process by setting up a data file on cassette tape to maintain records of your checking account.

Once you understand how the program works, you can easily modify it to handle similar types of information.

Changing Information In The File

Here is some information about the program's operation. Suppose an error was made in an entry when a file was created. Lines 5000–5120 show how the error can be corrected. First, the file must be opened for output, read into memory, and closed. The program then asks for the item to be changed (line 5025) and searches for a match (lines 5030–5040). If the item is not found, the program asks for another item to be changed (line 5045). As with the file creation section, entering STOP for the search item ends the entry process.

The program is set up to search for check numbers, but this can easily be changed. For example, if you changed the C\$(R,1) in line 5035 to C\$(R\$,2), you could search for a particular payee name instead. After all corrections have been made, the file is opened again for writing (line 5090), the entire file is rewritten (lines 5095–5115), and finally the file is closed (line 5120).

Adding Data To The File

As your data base grows, so does the length of your file. Lines 6000–6080 show how data may be added to a previously created file. The original file must be opened, read into memory, and closed by the file-reading routine. When data is added to a sequential file, it is added at the end of the existing data. To add data, the computer must know where the last record is located. The reading routine provides that information in the variable R1. Line 6015 checks to see if the file already contains the maximum number of records. Line 6030 starts the addition at the next available record, R1+1.

The new data is entered in lines 6035–6045. As before, entering STOP for the check number will end the entry process. Entry will also end when the maximum 25 entries are made. After all the new entries have been made, lines 6060–6080

PAPER CLIP Word Processor — CBM/C64	60
ORACLE Data Base from Batteries Included	89
SPINNAKER Software C64, Apple, IBM, Atari	
Computel's First Book of PET/CBM	- 11
POWER ROM Utilities for PET/CBM	78
WordPro 4+ - 8032, disk, printer	285
VISICALC for PET, ATARI, or Apple	189
Compute's First Book of 64 Sound & Graphics	11
SM-KIT enhanced PET/CBM ROM Utilities	40
PET Spacemaker II ROM Switch	36
Compute's First Book of Games	11

Dust Cover for PET, CBM, 4040, or 8050
CmC Interfaces (ADA1800, ADA1450, SADI in stock)
Computal's Reference Guide te 64 Graphics
Computel's Machine Language for Beginners
HES Seftware and Hardware in stock

FlexFile for PET/CBM/C64

DataBase, Report Writer with calculations, Mailing Lists. Easy to use, and can be modified.

FORTH for PET/C54 full FIG model — Cargile/Riley 50 includes all FORTH 79 Standard extensions, structured 6502 assembler with nested decision macros, standard 16x64 screens, ability to read/write BASIC sequential files, sample programs, introductory + reference manual.

Metacompillor for FORTH for independent object code 30
Floating Point for FORTH 20
KMMM PASCAL IV for PET/CBM/C64 99

Virtually full Jensen-Wirth implementation is now suitable for advanced placement courses.

EARL for PET/CBM Disk-based ASSEMBLER 65

SuperGraphics — BASIC Language Extensions 45
Fast graphics, sound, turtle graphics routines for PET/CBM.
RAM/ROM for PET/CBM 4K \$75 8K \$90

COMAL Language for C64, CBM, PET 14
CRM Public Domaio Software — C64, 27 disks 75

CBM Public Domain Seftware — C64 27 disks STAT for PET/CBM/C64 and Annie

Comprehensive Statistical Analysis Routines
Includes complete file handling capabilities, summary statistics, confidence intervals, hypothesis tests, exponential mean
tests, multiple and power series regression, analysis of varicnce, histograms, and non-parametric tests.

PageMate 60 Command Word Processor

Full-featured package for all Commodore computers. Full screen editing, and supports disk, tape, and all printers.

WRITE FOR CATALOG. Add \$1.50 per order for United Parcel. We pay balance of UPS surface shipping charges on all prepaid orders (add extra for mail, APO/FPO, air). Prices include cash discount. Regular prices slightly higher. Prices subject to change.

open the file for writing, write the file (including the new entries), and close the file.

Other Features

The program includes routines to display the records sorted by check number (lines 2000–2060) or by payee name (lines 3000–3050). Both of these use the simple sorting routine in lines 9000–9035. Also included is a routine which will find the payee name and amount when given the check number. As with the correction routine, it would be simple to modify this to search for check number when given the payee name.

Another user-friendly feature is the subroutine at line 9900. This halts the program until you rewind the tape, to insure that you will always begin recording at the start of the file.

Customizing The Program

It may be more efficient to have a separate program for each of the functions, particularly if you have only limited memory, as with the unexpanded VIC. Each of the major routines presented here can be separated into an individual program. Note, however, that most of the routines call other routines. For example, the routine in lines 2000–2055 also needs lines 8000–8040, 9000–9035, and 9900.

The screen displays in the program have been set up for the VIC's 22-column screen. If you are using a 64 or PET/CBM, you can adjust the PRINT statements so that the output will look better on your wider screen display. No other modifications are necessary, but 64 users should remember that the 64 screen display will blank while the program is searching for or reading the file. Also, when the file is found, you'll need to press the Commodore logo key for the reading to proceed.

For unexpanded VICs, not enough memory is available to set up the array for 25 checks. To prevent an OUT OF MEMORY ERROR, you'll have to change the DIM in line 110 to C\$(5,3) and the 25 in lines 1025, 6015, 6030, and 8010 to 5. You'll also need to omit spaces everywhere in the program except in the PRINT statements. A file of five records isn't long enough to store a useful amount of information, but it will illustrate the principles of data files. On the other hand, if you have a 64 or PET/CBM, you may have enough memory for arrays of more than 25 rows, and changing the lines mentioned above will allow you to create files with more records.

Disk Modifications

The procedure for creating and manipulating disk data files is essentially the same as that for tape data files. In fact, working with disk files is much easier, since it is not necessary to constantly stop and rewind the tape. Also, the reading and writing is much faster.

To use the program presented here with disk, first delete all the lines which refer to rewinding the tape: 1005, 1010, 2005, 3005, 4005, 5005, 5015, 6005, 6020, and 9900.

These are the lines which must be modified to use the program with a disk drive:

```
1015 OPEN 1,8,8,"0:CHECK INFO FILE,S,W"
5090 OPEN 1,8,8,"00:CHECK INFO FILE,S,W"
6060 OPEN 1,8,8,"00:CHECK INFO FILE,S,W"
8005 OPEN 1,8,8,"0:CHECK INFO FILE,S,R"
```

MacroDOS For Atari

Part 1

Jerry Alen

This utility will simplify Atari disk operations, allowing you to read the directory and erase files without losing the program in memory.

MacroDOS is an instant access disk utility package for a one- or two-drive DOS 2.0 system. MacroDOS uses only three pages of RAM and therefore can be permanently coresident in memory with the FMS. You can pretty well forget about MEM.SAV. And when you call DOS, you won't have to worry about losing your BASIC or machine language program when you return. The utility can also be used without a cartridge.

MacroDOS supports all the normal DUP functions excepting file and disk duplication, some of which can still be accomplished with the SAVE (binary file) command. Also, MacroDOS incorporates a new feature to DUP systems: hex or dec RUN and address entries, and a permanently available hex-to-decimal, decimal-to-hex converter. You'll have no more lost time looking for that subroutine, which must be around somewhere, or couldn't be loaded anyway because it conflicts with something that is in memory.

You will still be allowed the option of using Atari DUP, but now, before you take that step, the directory can be safely checked to confirm that MEM.SAV is indeed there.

A Safe Location

MacroDOS resides in memory after the FMS, where Atari DUP would normally load. The big difference here is that it pushes MEMLO up to stay out of the way of your programs. You will still have use of page 6, page 4, and even page 1. When SYSTEM RESET or BREAK is hit, MacroDOS will reinitialize itself unless you have exited to Atari DUP, which resets the old vectors.

Some of the MacroDOS operations differ slightly, but if you have used Atari DOS-DUP, there is really little to learn, and you may even find that the new operation is easier to master and execute.

When working with MacroDOS, you should

be using DOS.SYS 2.0S in the same (or a smaller) configuration that comes on your master disk. If the listing for the machine language program (Part 2, next month) is used, you should be able to realign the program for larger versions of DOS.SYS using more buffer space. The program will check MEMLO and change everything accordingly.

The program included this month, however, is for BASIC users, and it's constrained to using a version of DOS.SYS which, after it has loaded, has a MEMLO of 7420 (\$1CFC), or less. Use the direct mode command as follows to check if in doubt: PRINT PEEK(743) + 256*PEEK(744). If your DOS.SYS has not been altered from the master disk, MEMLO will be 7420.

A Few Prompts To Learn

There are a few new prompts. First is the > prompt, which expects the return of a function command's first letter. The directory, format, and write DOS functions use the prompt D# and expect just a single number of 1–4, or just a RETURN, which defaults to drive 1. The format command also uses a? to ask if you're sure, and looks for a Y or YES before proceeding.

Functions requiring a filename use FN?. The device name (D:, D1:, or D2:) must be included in the name. Rename (RNM) requires only one device name and none for the name after the comma. The @ prompt is used to mean "at" or "to" when an address input is required. Asterisk wild cards are still allowed.

MacroDOS Commands

[D]IR – used to read the disk directory. The second prompt requires a drive number of 1–4 or RETURN only for drive 1.

[R]NM – rename a file. As in Atari DUP, use the device name only with the old name (that is, D3:MAC*.*, AUTORUN.SYS).

[*]LK - lock a file.

[U]n* – unlock a file.

[F]MT – format a disk. Answer SURE? (?) with a Y. Give drive number.

[E]RS – erase file. [C]RT – return to cartridge; BASIC or Assembler.

[S]AV - save binary file. Enter the filename at EJ 90 RETURN the prompt. Do not use commas. Enter the from address at the @ prompt. Then the to address at the next prompt. The numbers given can be hex or decimal or both, but must be preceded by a \$ for hex or a period if decimal. This command allows appending to an existing file if a slash (/) is used after the last letter of the filename. RUN and INIT addresses must be added by appending to a file. POKE (or use command C in DEBUG) 736,737 (\$2E0,\$2E1) for RUN, and 738,739 (\$2E2,\$2E3) for INIT. Remember to POKE low, high. Then go to MacroDOS and append the addresses you just changed to the file. Do not hit SRESET between the POKEs and the SAVE or 736–739 will be cleared.

[L]OD – binary load.

[@]RN - run at address. Hex or decimal. [W]DS – write DOS.SYS (only).

[\$]>. - hex to decimal. Enter \$ and # together. Range: \$00 to \$FFFF.

[.]>\$ – decimal to hex. Enter a . and # together. Range: .0 to .65535.

[!]DS – escape to Atari DOS (DUP.SYS). Remember that without MEM.SAVE on a disk without write protection in drive 1, programs will be wiped out. After using this command, you'll have to reboot or load from Atari DUP using MEM.SAV. (I don't use the letter A because it's Atari's DUP DIR command and too easy to accidentally use. The ! forces you to shift, and therefore, to think a little more.)

In Part 2, we'll continue the discussion of MacroDOS features, and present the machine language source code.

If you don't want to type in the programs, send \$3 and a disk or tape with an SASE mailer.

Jerry Allen 1906 Carnegie #E Redondo Beach, CA 90278

VIC And 64 TRACE

Roger Harris

Debugging is far easier if you can watch your program in execution. This program adds a valuable TRACE feature to your debugging toolkit.

Some versions of BASIC have a feature called TRACE, for debugging programs. Apple BASIC has a typical implementation: When the interpreter executes a program with TRACE enabled, the line number of each executed line will be printed on the screen. This allows you to observe the path being taken through your program.

This information can save a great deal of effort in locating logic errors—problems caused by improper program flow. In BASIC, such problems can be caused by using the wrong line number on a GOTO or GOSUB, or by using the wrong variable or conditional test in an IF statement. Tracing, you can determine the first point at which the program begins to behave oddly.

Commodore Upgrade BASIC, used by the VIC-20 and 64, does not have a TRACE. However, the BASIC program presented here will load a machine language (ML) routine which provides the same capability. When the program is run, the ML is read from DATA statements and POKEd into memory. After it's been loaded, you may delete the BASIC program with a NEW command. Now, enter or LOAD your program and RUN it normally.

Taking A TRACE

With the trace routine loaded, a SYS statement may be used to call a subroutine which will enable the trace. The SYS command is always followed by the address of a machine language routine. In this case, the address will depend on where the ML program was loaded, as I shall explain presently. There is another SYS address to disable the trace. You may enter either of the SYS state-

ments before you RUN your program, or they can be statements within the program itself.

The trace produced by the routine will consist of a series of program line numbers, separated by spaces. This display will "wrap" at the end of screen lines, with no attempt to avoid splitting the numbers. Any PRINT output produced by your program will be intermixed with the line numbers.

An unusual feature of this trace is that it will show you the result of each IF statement executed. These results are indicated by printing a T or an F (true or false) after each line number that contained a conditional statement. Statements with multiple conditions will cause a T for each test which is true, or an F for the first condition which is false. It is often very important to know if the conditional part of a statement was executed; this feature gives you an easy way to verify that the program is making its decisions properly.

On the VIC or the 64, you can press the STOP key at any time when your program is running. You will get a message, BREAK IN 150, for example (meaning that the program stopped at line 150), and you will get the READY prompt. You may then resume execution with a CONT (continue) command. When the trace is enabled, you will occasionally find it necessary to use the STOP key to prevent the trace from scrolling off the screen too quickly. In some cases, you may want to add some STOP commands to your program. You can also edit your program to turn the trace on only at critical sections and turn it off for sections which are not under observation. When a program has been STOPped, by the STOP key or command, you may enter any immediate mode statement, such as a PRINT statement to display your variables (?A,B\$,F), or a calculation. You may also change the value of variables with assignment statements (for example, X = 4). You can still use

Our RS-232 Serial Interfaces allow you to connect printers, modems, plotters, and other input/output devices to your 64 or VIC-20.

Commodore produced good computers that were economical for families. Our president wanted to provide Commodore owners with better peripheral products.

In less than two years, MSD was shipping interfaces that expanded the Commodore 64, VIC-20, and PET computers into business and developmental applications ... THE SERIOUS WORLD OF COMPUTING.

Next, determined to BUILD IT BETTER, MSD developed SUPER DISK I and II ... exceptionally fast and durable disk drives that NEVER OVERHEAT.

MSD's dual drive formats, copies, and verifies in less than two minutes ... compared to 30 or 40 minutes with TWO Commodore 1541s. This unparalleled speed has made SUPER DISK II the hottest product introduced for the Commodore line of computers!

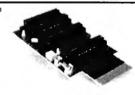

Add the six month warranty, and you can see why our dealers and their customers believe in us. MSD SYSTEMS, INC. ... Call us today for your nearest local dealer.

A parallel interface allows direct access between a centronics printer and your software program, saving you loading and waiting time. Our CPI is compatible with most software written for the 64 and VIC-20.

For professional-quality video and audio output, our **Monitor Link Cables** can connect your 64 or VIC-20 to a high-resolution black/white or color monitor, or a CRT terminal, and to a stereo system.

The **CEX-4** Expandoport gives you four additionary ports for interfaces and peripherals.

Save time and hassle with the greater speed of an IEEE Interface. The unit is 'transparent' to your computer's expansion port, allowing hookup to any peripheral without interference. With this interface, your 64 or VIC-20 can gain CBM/PET-type control over the IEEE-488 bus.

SYSTEMS, INC.

10031 Monroe Dr. • Suite 206 • Dallas, Texas 75229 214-357-4434 • Outside Texas 800-527-5285 CONTinue to resume execution, or you can GOTO a particular line number. However, the system will not allow you to CONTinue if you change the program, or if you enter a statement which causes a syntax error. If you edit a statement, you may still use the immediate mode GOTO, but you will have lost the previous value of any variables.

The trace function will not solve all your debugging problems, but obviously you must find a bug before you can fix it. When you can't find a bug by reading the listing, it's time to start investigating, to start TRACEing. You must determine what the program is really doing. The PRINT statement and STOP command are the BASIC programmer's primary debugging tools, but a trace is often the fastest way to find problems caused by failure to execute the proper instruction at the proper time.

The Loader Program

The program is a relocating loader, which will work on any VIC or 64. The program steals 248 bytes of memory from BASIC to load the machine language routine. The routine will not fit in the cassette buffer. Line 10 of the program PEEKs the current BASIC "limit of memory" from locations 55 and 56, and subtracts 248. (The number PEEKed from 56 is multiplied by 256 because it is the high byte of the two-byte address, and 55 is the low byte.) The address saved at 55 and 56 is the highest address, plus one, of memory available to BASIC. The initial address, minus 248, will be the new top of BASIC memory. Line 15 converts this address back to high byte and low byte. Line 20 POKEs these bytes back into 55 and 56, and does a CLR (clear variables) so that BASIC will recognize the new memory limit. The variable TRACE is then set in line 25 to be the new limit of BASIC. This will be the starting location for POKEing the machine language. If your program needs to allocate some memory for custom characters or screen buffers, you can set 55 and 56 to the required value before you run the loader; the routine will always be POKEd above the "current" limit.

This technique will also work on the 64, but you probably will not have to steal any of BASIC's memory; there is a 4K block of memory starting at 49152 which is not used by BASIC. Unless your program is already using that memory, you can change line 10 to set TRACE = 53000 and completely omit lines 15, 20, and 25. 53000 is a particularly good location, since the number is fairly easy to remember, and the routine will use only the last 248 bytes of the 4K RAM. This will leave the beginning of that memory available for programs which use custom characters, sprites, or other ML routines.

Whatever TRACE is located will also be the SYS address which will enable the trace. TRACE

plus 24 will be the SYS address which disables the trace. For example, on the unexpanded VIC, TRACE will normally be set to 7432, so SYS 7432 will turn on the trace, and SYS 7456 will turn it off.

All lines from line 30 down should be included in any version of the program. Line 50 of the program is the beginning of a FOR loop which READs the DATA statements. The trace routine is not inherently relocatable; it uses many absolute addresses. Fortunately, all the external (system) addresses used are the same on the VIC and the 64. This leaves only the problem of addresses of internal subroutines and working storage. The loader program does the relocation by checking for negative numbers in the DATA statements; a negative number indicates a place where a twobyte absolute address is required. The address generated will be the absolute value of the negative number, plus the initial value of TRACE. When all the data has been POKEd, the program re-POKEs two locations which are also dependent on TRACE.

As Always, SAVE Before RUN

As always when typing in programs, you must be careful to get all the numbers correct, and you should save a copy of the program before you run it. If any numbers are wrong in the DATA statements, the results will be unpredictable. When it is run, the program adds up the numbers from the DATA statements and compares the total to the correct sum. This will catch most errors, but it is not foolproof. If the sum is correct, the program will say TRACE READY and display the SYS addresses which will enable and disable the trace. Please be very careful when using any SYS statement; there is a high probability that your computer will "lock up" if you use a wrong SYS address. Such a state can only be fixed by turning the power off and then back on.

How Trace Works

The routine which enables the trace places a three-byte JMP (jump) instruction into locations 124, 125, and 126. This overlays the middle of the CHRGET subroutine, which is used by the interpreter to fetch characters from the BASIC program. The destination of the jump is the beginning of the trace handling routine. This technique is sometimes called a *wedge*.

When the trace routine is activated, each fetched character will arrive in the A register. If the byte is a space character, the routine jumps back to CHRGET to get the next. Otherwise, the character is pushed on the stack. Next, the program checks a flag which indicates the presence of a conditional statement. The routine then compares the current line number, stored by BASIC at locations 57 and 58, to the line number which

was last displayed. If a new line is being executed, the new line number is saved for future reference, and is converted from 16-bit binary to ASCII decimal characters for printing. (However, the routine does not output the line number if it is greater than 64000—BASIC puts a high value in the "current line" location when it is interpreting an immediate command.) Each character of the line number is output to the screen by calling the Kernal (operating system) subroutine CHROUT.

The routine then pops the fetched character from the stack, and checks if the character is the BASIC token (one-byte representation) for a THEN. If so, a flag is set. The presence of a THEN indicates a conditional statement which is about to be resolved. I originally thought that the next call to the trace routine could determine if the condition was true or false by checking for a change in the line number. However, BASIC will make one more call to CHRGET even if the condition is false. Therefore, the flag processing is designed to wait for one call before deciding whether to output a T or an F. If the line number has not changed by then, the condition was true.

The routine always returns the fetched character to the interpreter, with the status register (condition codes) set, as CHRGET normally does.

The routine which disables the trace does so by restoring CHRGET to its original state.

This index-sequential file manager gives you a new dimension on direct access files. Up to 40 keys, various length for each record and up to 10 files can be handled at the same time by this sophisticated module. How could your programs survive without SM-ISM?

Apple Variable Save

Jeff Brewster

Modifying lines in Applesoft BASIC programs can be time-consuming when variables are lost. Here is a machine language program to solve that problem. It saves and automatically resets pointers to variables, letting you easily interrupt programs for modification and debugging.

In Applesoft BASIC you will lose variables whenever a program is modified. This is especially troublesome during program development and debugging when many changes must be made and their effects determined. Each time a line is changed, it is necessary to reexecute the entire program due to the loss of variables. When the program involves long calculations or many operator INPUTS, this requirement makes program modification a slow, frustrating process.

By using this short machine language program "VARSAV," you can avoid much of this trouble. A running program can be interrupted with CTRL-C or RESET; program lines can be modified, added, or deleted; and execution can be resumed with the CONT or GOTO command. All the variables will still be there, ready to use (provided no unusual commands are entered which would disturb the stored variables or their pointers—these forbidden commands are discussed below).

Programming Considerations

This modification to BASIC is implemented by having Applesoft call VARSAV when keyboard input is required, instead of the usual routine KEYIN. VARSAV consists of two parts: the functional part of the program and a short initialization

sequence which must be run to connect VARSAV to Applesoft. The initialization routine sets the KSW pointer at \$38–\$39 so that VARSAV is called when keyboard input is required; it also patches a new routine into the RESET sequence so that VARSAV remains connected even after a system RESET. START calls KEYIN to read the keyboard and then saves or restores certain pointers which tell Applesoft where variables are located in memory.

VARSAV occupies 96 bytes, including the seven-byte storage area RSAVE, and can be located anywhere in memory. The program is entered most quickly from the monitor (CALL-151) using the hex dump in Program 1. It is convenient to type in the program as written, list it to find errors, and then make any location-dependent changes.

The main program is in page 3 of memory (pages are 256-byte groupings), a usually vacant area, while allowing the initialization routine to reside at the top of page 2. This keeps the initialization sequence, which is used only once, out of valuable page 3 memory space.

VARSAV is conveniently implemented on a disk system by including a BRUN VARSAV instruction in the greeting program so that VARSAV will be loaded and run whenever the disk is booted. The use of VARSAV is straightforward and nearly transparent to the operator. You needn't grasp the program's operation to use VARSAV, so skip the next section if the details do not interest you.

Saving And Restoring Variables

Variables are stored by Applesoft in tables, starting at the end of the program and moving up in mem-

ory. Simple variables are stored in the lower segment of the variable space; array variables are in the upper segment. As new variables are defined, they are added to the end of the existing tables. String variables are actually stored in two places: the name of the string and a pointer are stored in the appropriate variable table (simple or array), while the string itself is stored at the top of available memory. New strings are added at the top of memory, working down, while their pointers are stored in the variable table, working up.

To keep track of the variables, Applesoft has four pointers in zero page (\$69 to \$70, 105 to 112 decimal) which define the start of the simple variable table, the start of the array variable table, the end of variable storage, and the start of string storage. Their functions are described more fully on page 140 of the Applesoft II Reference Manual.

The first pointer is set automatically to the end of the program by Applesoft when the program is loaded, or by entering or deleting a program line. This pointer can be changed to a higher value with LOMEM or a POKE, permitting the programmer to leave a space in memory between the program and the variable tables. The other pointers are not directly accessible.

At the beginning of a program, the second and third pointers are set equal to the first, while the fourth pointer is set equal to HIMEM. As variables are assigned by the program, the pointers are updated. Since variables are never deleted from the variable tables, the pointers never decrease in value during program execution. When a new line is entered, however, these pointers are reset to their initial (default) values, so that it appears to Applesoft that no variables have been defined. The variables and strings themselves are still in memory waiting to be used—Applesoft just doesn't see them.

If the pointers could be saved somewhere before they were reset, and then restored after the new line input, Applesoft would then be able to use the variables already assigned. This could be done by using the monitor M command (Move) to store the pointers in a convenient location, returning to BASIC to make program changes, and then using the monitor again to restore the variable pointers from the storage area before continuing execution. VARSAV simply performs these operations automatically via the routines SAVE (save pointers) and RESTOR (restore pointers) each time the keyboard is read.

The appropriate operation is selected by comparing the current value of the pointer to the end of variable storage (\$6D-\$6E) to the stored value of this pointer. If the stored value is less than the current pointer value, a SAVE operation is performed; a RESTOR operation occurs if the current pointer value is less than the saved value.

Generally, this means that when the pointers are updated they are SAVEd the next time keyboard input is requested. RESTOR occurs after keyboard input only if the variable pointers have been reset to their default values.

VARSAV makes this comparison each time the keyboard is read unless the character entered is CTRL-C. In that case, a SAVE operation is performed regardless of the current value of the variable pointers. This exception is necessary in order to permit the variable tables to be cleared. To clear the variables, enter the CLEAR command (then carriage return) followed immediately by CTRL-C.

Program Modification And RESET

How to use VARSAV is best learned by considering the sample program "VARSAV Test" (Program 2). Assume that VARSAV is in effect and that VARSAV Test is RUN. Execution will halt at statement 110 with a SYNTAX ERROR due to the misspelled NEXT. At this point the storage area holds the default values of the variable pointers, while the pointers themselves contain the current values assigned by Applesoft. These values must be saved before changing line 110. Entering the following line (or hitting any key) will accomplish this:

110 NEXT I

As the first character of the line is entered, a SAVE operation is performed, preserving the variable pointers. When you hit RETURN, Applesoft will process the line, checking the first nonblank character to determine whether this is an immediate mode command or new program line input. Since the first character is a number, the line is treated as new line input, and Applesoft clears the variable pointers to their default values and stores the new line in memory.

Suppose the command GOTO 90 is entered next. When the G is entered from the keyboard, VARSAV will test the end of variable space pointer and determine that its (default) value is less than the stored value. This results in a RESTOR operation which sets the variable pointers back to their original (correct) values. The variables will be printed out as if there were no changes made in the program at all.

To further complicate things, the effect of the RESET key has to be reckoned with. As mentioned previously, VARSAV is called via the KSW vector at \$38–\$39. Applesoft makes an indirect jump to the address held by the KSW vector whenever keyboard input is required. VARSAV sets the KSW vector to point to itself instead of the normal input routine KEYIN.

When RESET is hit, a number of operations occur which set the Apple's video output, I/O vectors, and soft switches to defined states. The

RESET sequence ends with an indirect jump to the address held in the soft entry vector (SOFTEV) at \$3F2-\$3F3, which returns control to the current operating language. As part of the sequence, the KSW vector is changed to its default value (pointing to KEYIN), thus disconnecting VARSAV.

To counter this, VARSAV sets the soft entry vector to cause a jump to its own reset routine, which reconnects VARSAV via the KSW vector,

and then exits normally to BASIC.

The task of setting these two vectors (KSW) and SOFTEV) is even more complicated when DOS is present. DOS is also connected to Applesoft through the KSW vector, and calls to VARSAV must be routed through DOS. In addition, DOS must set its own pointers after a system RESET just as VARSAV must. Thus, VARSAV must pass the value of KSW to DOS, and warmstart DOS (and BASIC) after a system RESET.

As was mentioned, only the pointers, not the variables themselves, are lost when program changes are made. This is true only when the change does not lengthen the program. If the program is lengthened, the lower end of the variable table will be overwritten by program lines

and permanently lost.

This problem is easily avoided by using LOMEM to establish a space in memory between the end of the program and the start of the variable tables. This space is then available for additional program line storage without disturbing the variables. A space of 256 bytes is adequate for about eight BASIC lines; such a space is easily allocated by using the following statement as the first line of each program:

1 LOMEM: PEEK (105) + PEEK (106)*256 + 256

If many changes are anticipated, the space can be made larger by increasing the last value in line 1. A more compact equivalent statement is:

1 POKE 106, PEEK (106) + 1

Again, the space can be increased in 256-byte increments by increasing the last value in the line.

Using VARSAV

Once VARSAV has been loaded into memory, start the program from the beginning to set the KSW and SOFTEV vectors. The program as presented can be started with CALL 755. If the program is relocated, start it using a CALL to the first byte of the program. Load or enter a BASIC program as usual (try Program 2 the first time). Before running the program, enter CLEAR followed by CTRL-C to initialize the storage registers; then set LOMEM at least several hundred bytes beyond the end of the program to allow room in memory for added program lines. This can be done by entering LOMEM from the keyboard, or by incorporating one of the statements found in the previous paragraph, into the program.

Start execution as usual with RUN or GOTO. The program can be interrupted at will, changed, and execution will still continue without any loss of variables. Problems with VARSAV will occur if commands are entered from the keyboard which alter the variable tables or their pointers. Changing HIMEM or LOMEM may do this. Changing LOMEM will have no effect unless followed by CTRL-C, in which case all variables are lost; changing HIMEM will affect only strings.

Of course, altering HIMEM or LOMEM can destroy variables whether VARSAV is in use or not, so these commands should never be used after variables have been assigned in a program. Another problem can result if a program is run when the pointer storage area of VARSAV contains garbage, or pointer values from another program. The CLEAR, CTRL-C sequence described above should always be used to clear the pointer storage area before running a program.

This could also be done automatically by placing the following line at the beginning of each program:

2 CLEAR: CALL 808

With these simple precautions in mind, VARSAV can make programming and debugging in Applesoft a more pleasant, a faster job.

Graphics 0 Text In Four Colors

Ted Baldwin

Add four-color text to your Atari screen displays. These five programs demonstrate the ANTIC 4 display mode and allow you to save redefined characters for use in other programs.

ANTIC 4 is a little-known Atari display mode. Similar to GRAPHICS 0, it is a character mode, with 40 columns and 24 lines per screen, and uses all 256 characters. However, it also has the capability to display characters in four colors.

This is a result of the way ANTIC 4 interprets the character pattern. GRAPHICS 0, for instance, reads the character pattern one bit at a time. Each bit corresponds to one pixel of the character on the screen. The 1 bits are displayed at a different brightness than the 0 bits. ANTIC 4, on the other hand, reads the pattern two bits at a time. Each bit-pair corresponds to one pixel of the character. There are four possible combinations of two bits: 00, 01, 10, 11. Each combination represents a different color. The color corresponding to the bit-pair 00 is stored at location 712; the color for the bit-pair 01 is at location 708; the color for bitpair 10 is at 709; the color for bit-pair 11 is at 710.

Redefined Characters

Program 1 converts the display to ANTIC 4. Running the program will reveal one of the drawbacks of ANTIC 4: The normal character set is useless. The characters on the screen are garbled because the normal character patterns are not designed to be read in bit-pairs. In order to make any practical use of ANTIC 4, you must redefine the character set.

Program 2 does that. The bit pattern for each character is designed so that the characters will appear in different colors. Specifically, typing lowercase letters will display light blue uppercase letters; typing uppercase letters will display gray uppercase letters; typing a number will display that number in gray; typing a shifted number will display that number in blue-green.

Program 3 demonstrates the use of these characters in ANTIC 4. Be sure to run Program 2 before running Program 3. The program first dis-

plays normal GRAPHICS 0 text. Then it switches to ANTIC 4 and displays four-color text using the redefined character set. The colors are changed to orange, green, and blue-green on a pink background.

Program 4 saves the redefined character set to disk and should be run after Program 2. Program 5 loads the character set back in. Your own filename can be substituted in line 140 of both programs.

You can add four-color text to your own programs by using Program 5 to load the character set and Program 1 to switch to ANTIC 4. Besides making your programs more colorful, these routines enable you to highlight important messages.

Refer to the "Automatic Proofreader" article before typing these programs in.

Atari TAB

Stephen Levy, Editor, COMPUTE! Books

Atari BASIC has no built-in TAB or SPC functions. Here are four ways you can set up TABs.

Although there are no TAB or SPC functions built into Atari BASIC, the functions do exist. It is true that these functions are somewhat less convenient than those found in other BASICs, but they are no less powerful.

Most Atari users overcome the need for a TAB by using the POSITION statement. The POSITION statement is similar to the TRS-80 command PRINT AT. The short program below will illustrate how the POSITION statement works.

```
10 PRINT CHR$(125)
20 FOR X=0 TO 20
30 POSITION X,X:PRINT X
40 NEXT X
```

Two zero page locations are useful when the TAB function is needed. The following program accomplishes the same task as the previous program, but uses a POKE to location 85.

```
10 PRINT CHR$(125)
20 FOR X=0 TO 20
30 POKE 85,X:PRINT X
40 NEXT X
```

The number POKEd into 85 is the actual column to which the cursor is moved. If the cursor is at column 30 and the computer encounters a POKE to 85 less than 30, the cursor will move to the next line. The cursor will not move to the specified location until something is actually printed on the screen.

The second useful page zero location is 201. Location 201 contains a 10 when the Atari is turned on, which means that the tabs have been set to 10. By POKEing another number into this location, we can change the tab settings. Placing a comma after a PRINT statement will cause the next PRINT statement to print at the next available tab stop.

Try this:

POKE 201,15:PRINT "COMPUTE!", "Magazine"

Notice how the words have been separated. The next example will help you understand how different numbers POKEd into 201 will affect the tab stops. The program will accept only numbers from 4 to 29.

```
10 PRINT CHR$(125)
20 TRAP 20:PRINT "HOW MANY SPACES BE TWEEN TAB STOPS";:INPUT TAB
30 IF TAB<4 OR TAB>30 THEN 20
40 POKE 201, TAB
50 PRINT :PRINT "POKE 201, ";TAB
60 COL=PEEK(85):PRINT COL,
70 IF COL+TAB>38 THEN 90
80 GOTO 60
90 PRINT :GOTO 20
```

If you POKE 201,1 the computer will leave three spaces. Likewise, POKE 201,2 will leave four spaces. POKE 201,0 will cause problems when the next PRINT statement with a comma is encountered.

Spaces

Perhaps the simplest method of leaving spaces between prints is to put spaces within quotes. This may be the preferred method when spacing is used just a few times within a program. However, when this method is needed often within a program and the number of spaces will vary, it may be convenient to create a string of 38 spaces. Once the string is created, you need to call only the number of spaces required.

```
10 DIM SPC$(38):SPC$=" ":SPC$(38)=SP
    C$:SPC$(2)=SPC$
20 PRINT "15";SPC$(1,15);"spaces"
```

Nicely Formatted Names

Let's assume you wish to create a listing of names, nicely formatted on the screen. You can use any one of the methods discussed here. Each program

SuperTerm — the only software that communicates with them all! Information networks such as CompuServe; business and university mainframes; free hobby bulletin boards.

Professionals and students: SuperTerm's VT102 emulation gets you on-line in style. Advanced video features, graphics, full-screen editing, 80/132 column through sidescrolling, extended keyboard - perfect for EDT, DECMail, etc. Even download your workfiles and edit off-line! Full printer and editor support; other emulations available.

Researchers and writers: SuperTerm's built-in text editor helps you create, edit, print, save, send and receive text files — articles, stories, reports, inventories, bibliographies — in short, it's your information work station. Access CompuServe, Dow Jones Information Network, Dialog/Knowledge Index, Western Union's Easylink, The Source, and many more. Optional Sprinter accessory saves printing time and \$ (see below).

Computer hobbyists: Join in the fun of accessing hundreds of free bulletin board systems (BBS) for Commodore, Apple, TRS-80, etc. Text mode with all BBS systems; up/downloading with Commodore BBS systems (Punter protocol). Special protocol for up/downloading with other SuperTerm owners. Popular "redial-if-busy" feature for use with automodems.

Get the information you need, for business or for fun, with the software that communicates with them all!

Requires: Commodore 64, disk drive, and suitable manual- or auto-modern. Printer optional Software on disk w/free backup copy. Extensive manual in deluxe binder.

SuperTerm's

SPRINTER Accessory \$69°5

With the Sprinter accessory, SuperTerm can perform concurrent printing — as text appears on your screen, it's simultaneously printed on your printer. Includes all necessary hardware for connecting your parallel printer and computer via the cartridge port. Simply plug-in and go. Free utility software for printing and listing as a stand-alone interface.

Requires: parallel printer such as Epson, Gemini, Microline, C.Itoh. (Min. speed 35 cps.)

Commodore 64 is a trademark of Commodore Electronics, Ltd.

Garbage Collection On Commodore Computers Part 1

Jim Butterfield, Associate Editor

There's a sneaky event lying in wait for you within most Commodore machines. It's called garbage collection, and it will show up, seemingly unpredictably, in any of several ways. Your program may seem to run slowly or erratically in "spurts." The program may have frequent pauses, each of which lasts several seconds. Worst of all, the program may pause for much longer periods of time—a minute, ten minutes, or even longer—and will seem to have "crashed." The user might be tempted to turn the machine off, thinking that it has failed.

The garbage collection phenomenon isn't limited to Commodore machines, of course. Much of what is said here may be applied to other computers. The specific remedies that will be given for VIC, 64, PET, and CBM can be adapted to suit the different logic of other machines. Conversely, not all Commodore machines have garbage collection problems; for example, machines identifying themselves as 4.0 won't have these delays.

An Example

Try this on your computer:

- 100 DIM A\$(800)
- 110 FOR J=1 TO 800
- 120 A\$(J)=CHR\$(65)
- 130 NEXT J
- 140 PRINT "X"
- 150 PRINT FRE(0)
- 160 PRINT "Y"

It will take a few moments to perform the loop in lines 110 to 130. You would expect this. But unless you know about garbage collection, you won't expect much of a delay in the last three lines; after all, they are just PRINT statements.

Try it. If there's a delay between printing X and Y, that's a garbage collection pause.

To illustrate the odd nature of garbage collection, try this: Change line 120 to read A\$(J) = "A"—this is the same thing, of course, since CHR\$(65) is the letter A. But this time the delay disappears when you run the program.

Why It Happens

When a program assigns a value to a string variable, it may do so in either of two ways. If the string exists completely within the program, it will be used "where it lies"; there's no need to make a copy. For example, a program statement such as 500 X\$="HELLO" will use the string HELLO right out of the program where it lies. Similarly, the statements: 800 DATA COFFEE and 900 READ R\$ will cause the string COFFEE to be used from within the DATA statement; it won't be moved to any other place in memory. There doesn't seem to be a name for this kind of string: I'll use the term static string to refer to a string used directly from its place within a program.

On the other hand, some strings can't be used this way. If I create a string with an INPUT statement or by using a string manipulation command such as STR\$() or CHR\$(), the computer must find a place to put this newly formed string. This kind of string must be packed away into a string storage area. I'll use the term dynamic string to refer to strings of this type.

Now, let's suppose that a running program creates a dynamic string with the statement INPUT A\$. The user types in the string—say, EBENEEZER—which will be packed into the string

storage area. Later, the program loops and asks for more input with INPUT A\$, and the user now types in MARY. MARY, too, gets packed into the string storage area; but even though Ebeneezer is no longer needed (he's been replaced by Mary), the old string is not erased. Instead it lies dead in memory—as garbage.

Let's talk for a moment about the string storage area. It's located near the top of available BASIC memory: above the program, above the variables, and above the arrays. Dynamic strings are placed at the top of this area. As more and more strings are created, they work their way downward. Often, many discarded strings will be left behind—Ebeneezer and his friends—yet no attempt is made to reclaim the wasted space.

This type of thing continues until the dynamic strings bump into the top of BASIC, variables, and arrays. At that time, the waste space must be cleaned up; hence, "garbage collection."

Bad Timing

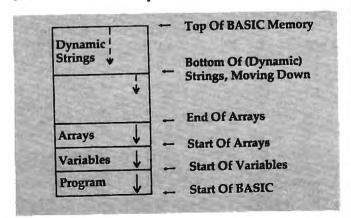

Garbage collection can take up a lot of time; more about this in a moment. Worse, it's hard to predict when it will strike. It's difficult to code in a JUST A MOMENT message when you don't know when that moment will arrive.

You can force a garbage collection by using the FRE(0) function. In order to measure free memory space, the BASIC interpreter must repack the strings. But doing this may not buy you much. You'll find that doing a garbage collection saves you no time on the next one. If the illustrative program above is still in your computer, restore the original line 120 and RUN. When the program is complete—pause and all—type GOTO 140. You'll find that the second collection takes just as long as before, even though we know there's no garbage to be collected.

You may estimate garbage collection timing by using this crude rule of thumb:

G.C. Time = (Number of dimensioned strings)
times (Number of dynamic strings)
divided by ten;
Answer is in milliseconds.

Caution: This is a very crude formula. The actual

time varies from machine to machine and is also dependent on average string length. If we work out this formula in terms of the example, we'll get 800 times 800 divided by 10, giving 64,000 milliseconds or slightly over a minute. Don't worry if your machine gave you a noticeably different time. It's the principle that counts here; and anything over a few seconds is too long. We must learn how to reduce this time drastically.

Causes Of Garbage Collection

All we need to do is learn not to leave waste strings lying around; no waste space, no need for garbage collection. That's easy for me to say, but it will take another article to go into the details of how to do it.

The following rules hint at the details that I'll give in the second part of this article:

- 1. Don't move strings around. It's tempting to move strings when your program is doing a sorting job. Don't do it; instead of moving strings, move an "index" array.
- 2. If you transfer strings into and out of computer memory in "blocks," set the unused strings to "null"; for example, A\$(X) = "". When your strings are at a minimum—just before reading in the next block—force a quick collection with FRE(0).
- 3. Identify the garbage-making areas of your program. The most common is a GET or GET# loop which builds longer strings through concatenation. By fiddling with pointers immediately before and after such operations, you can perform a "local" garbage cleanup with great savings of time.
- 4. Some arrays may be changed to numeric instead of string—for example, "April 6, 1984" may be stored as numeric 19840406. Reducing strings reduces garbage collection time.
- 5. If all else fails: When garbage collection seems imminent, write all strings to disk and clear them from memory; force a quick collection; read all the strings back in.

Details on all this next time. Copyright © 1983 Jim Butterfield

Programming 64 Sound Part 1

John Michael Lane

This in-depth look at sound for the 64 provides you with practical methods for controlling the 64's SID chip from BASIC. This two-part article starts off with a brief discussion of sound and music in general.

Sight and sound are two essential components of successful computer games. Though the methods used to produce visual images differ from one computer to another, it is not too hard to produce an image that looks something like what you want. When designing space games, it's really easy, because just about anything can look like a spaceship.

Producing sound, however, can be quite a different matter. How can you produce the sound of a laser gun when dealing with such unfamiliar concepts as frequency, waveforms, and envelopes? (Actually lasers don't make any noise,

but you know the sound I mean.)

Without a pretty expensive test setup, it can seem impossible to produce exactly the sound you're looking for. The only recourse is trial and error. Still, if you understand a little about the physics of sound and how it relates to the sound generator you're using, you can produce creditable results.

Real Sound

Sound is produced when physical objects vibrate. Vibrations are then set in motion in the air and travel through the air as sound waves to our ears. Sound, in its purest form, has only two physical attributes, *frequency* and *amplitude*. Frequency, the number of vibrations per second, is usually meas-

ured in cycles per second, or *hertz*. The higher the frequency or *pitch* of the sound, the higher a note sounds to our ears.

We've probably never heard a tone that consisted purely of one frequency. Physical objects also create vibrations at frequencies which are multiples of a fundamental frequency. The presence and quantity of these overtones determine the tonal quality, the *color* or *timbre*, of the sound. It's this tonal quality that determines whether a noise we hear sounds like a banjo or a drum (although there are other factors which we'll get to in a minute).

Different instruments and objects produce these overtones in varying amounts. Some produce strong overtones which are even multiples of the fundamental frequency. Some produce tones which are rich in the odd multiples. There really is no limit to the variety of tonal qualities that exist in the real world.

On some organs, and on some music synthesizers, you can specify the exact amount of each overtone you want included in each sound. On the synthesizer included in the Commodore 64, this is handled through the different types of waveforms that can be selected. But how does a waveform relate to tonal quality?

Waveforms

Figure 1 shows a sine wave at the fundamental frequency (all pure tones are sine waves) and at the first overtone or second harmonic. Notice that when we add the two waveforms together, the result no longer exactly resembles a sine wave. In Figure 2 we have continued adding sine waves of

Figure 1: Fundamental And Sound Harmonics Combined

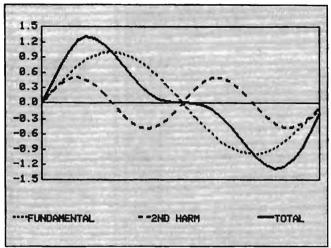

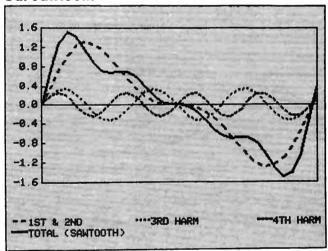

Figure 2:
Adding Third And Fourth Harmonics Brings
Out Sawtooth

higher harmonics. You can see now that the resulting total waveshape is beginning to resemble a sawtooth, one of the waveforms available from the Commodore 64's Sound Interface Device (SID). If we kept adding the higher harmonics until we reached infinity, we would have a perfect sawtooth.

So the shape of the wave actually defines the harmonic content of the sound. Since all pure tones are sine waves, the shape of the wave generated by a sound synthesizer is actually assembled from sine waves that are multiples of the fundamental frequency.

The Commodore 64's SID has a choice of three basic waveforms and white noise, which is a collection of random frequencies. The three waveforms are a triangular wave, a rectangular pulse wave, and a sawtooth wave. The rectangular pulse wave also has a variable pulse width or duty cycle, which allows you additional freedom to vary the color of the sound produced. None of

these waveshapes corresponds exactly to the sound produced by any instrument. It is also impossible to duplicate the complex harmonics of a real instrument simply by choosing one of these three waveforms. They do, nevertheless, give you the flexibility to produce a wide variety of color content, and you can get close to the particular sound you're seeking.

The harmonic content of the triangular wave diminishes very quickly, and the color of the wave consists almost entirely of the fundamental frequency. The sawtooth wave is the richest in terms of harmonics and the square wave falls in between. However, since the pulse width of the pulse wave can be varied, it can also contain a great variety of harmonic content.

Sound Envelopes

Earlier we said that sound consists of two qualities, frequency and amplitude. We've discussed primary frequency and how harmonic overtones are defined by the shape of the wave, but what about amplitude or loudness?

We don't mean how loud the sound is simply in the sense of volume, but rather how quickly the sound rises to its full strength and how quickly it dies down again to silence.

If you play an organ, you know that the sound of a note almost immediately reaches its full strength after you press the key and just as quickly dies down when you release the key. To our ears, it's just about instantaneous.

This is quite different from plucking a guitar string, where the sound quickly (but not quite instantaneously) reaches its full height and then slowly dies down, so that the tone continues several seconds after the note was struck. Violins, xylophones, banjos, and woodwinds all are different in the way that the sound rises, is sustained, and then dies down. Generally, these qualities are referred to as the *envelope* of the sound.

Figure 3: Waveform Shapes

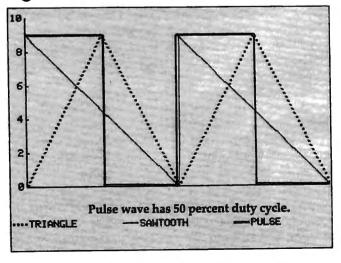

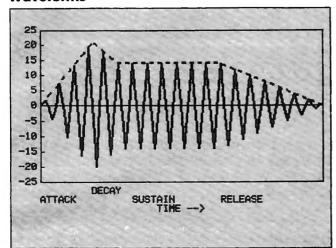

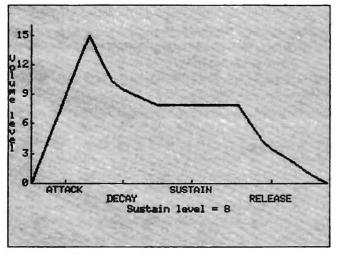

Figure 4:
The Envelope Defines The Height Of Individual
Waveforms

If you look at Figure 4, you will see how a sound looks if you could feed it into an oscilloscope. We can see the shape of the wave. The shape of the envelope defines the characteristics of a sound in a manner very similar to the way that harmonic content defines a sound.

The Commodore 64 uses a four-part sound envelope (see Figure 5). The first phase, called the attack, is the length of time it takes for the sound to reach its full volume. The second phase is the decay. During this phase, the sound decreases from the peak achieved during the attack phase to the level set for the sustain phase. During the third or sustain phase, the volume remains constant. In the final phase, the release, the volume decreases to zero.

Figure 5:
Attack/Decay/Sustain/Release Envelope

Not all sounds have this four-part volume envelope. Some have only an attack and release phase, and some (like the organ) have only the sustain phase. We can achieve all these on the Commodore 64 simply by setting the other phases to zero.

VALUE	ATTACK RATE	DECAY RATE	RELEASE
	=======		
0	2 ms	6 ms	6 ms
1	8 ms	24 ms	24 ms
2	16 ms	48 ms	48 ms
3	24 ms	72 ms	72 ms
4	38 ms	114 ms	114 ms
5	56 ms	168 ms	168 ms
6	48 ms	204 ms	204 ms
7	80 ms	240 ms	240 ms
8	100 ms	.3 sec	.3 sec
9	.25 sec	.75 sec	.75 sec
10	.5 sec	1.5 sec	1.5 sec
11	.8 sec	2.4 sec	2.4 sec
12	1 sec	3 sec	3 sec
13	3 sec	9 sec	9 sec
14		15 sec	15 sec
15	8 sec	24 sec	24 sec

The Commodore's SID allows us to set the attack, decay, and release phases to any one of 15 values or to zero. The times that correspond to the 15 values can be seen in Table 1. The times vary from milliseconds to seconds. Please note that the table does not include times for the sustain phase. The SID allows you to set a sustain volume level, but you must control the length of the sustain by opening and closing a *gate*. That gate is bit 0 of the fourth register in the SID chip. We'll cover this in greater detail later.

To turn the sound *on* in the SID chip, you must open the *gate*. As soon as the gate is opened, the sound level begins to rise at a rate determined by the attack. Once the peak level is reached, the sound begins to decline to the level set for the sustain. The rate at which it declines is defined by the decay.

However, if the sustain level is set at 15 (the highest choice), the decay phase is essentially meaningless because the sustain level and the peak of the attack phase are the same. Thus the decay phase has nowhere to decay to.

Once the decay phase is complete, the sustain cycle will continue as long as the gate is open. Once the gate is closed, the release phase begins and the volume falls from the level set for the sustain phase to zero. So, how long is the sustain phase?

Obviously, the sustain phase lasts as long as the time that the gate is open minus the time required for the attack and decay phases. If you close the gate too soon, you may have no sustain phase at all. If you close it really early, you'll cut short your decay or attack and decay phases as

Figure 6: Standard Four-Part Envelope

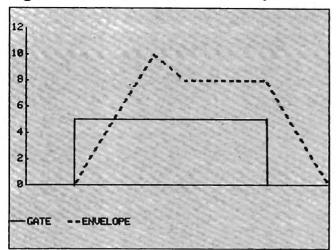

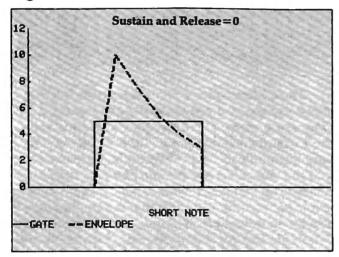

Figure 6b: Piano-like Envelope

well. Figure 6 shows several combinations of attack, decay, and release values and how they interact with the gate to produce the sound envelope.

Programming Sound

The SID is really a quite amazing chip. It takes just 29 registers in your computer's memory, and with those 29 registers (actually you won't even use them all) you can produce a great variety of sounds. We'll call them *registers*, but they're actually a row of 29 bytes of memory.

For our purposes, we'll consider only the first 21 registers in the SID chip. We'll also briefly consider the twenty-fifth register, which sets the volume (no volume, no sound).

The first 21 registers break down into three groups of seven. That's because the SID has three voices, and the seven register groups perform almost the same function for all three voices. That makes it far easier—all we have to learn is how to program seven registers.

Table 2 gives the functions of the seven register groups. Registers 0 and 1 hold the frequency.

Figure 6a: Organ-like Envelope

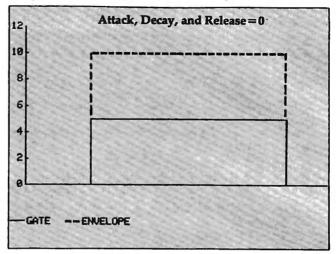

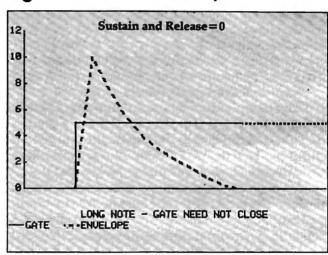

Figure 6C: Piano-like Envelope

Register 0 contains the least significant byte, and register 1 the most significant byte. With two registers you can record only numbers less than 65512. That sounds pretty high, but the frequency contained in the two registers relates to the internal oscillator (clock) of the Commodore 64 and does not translate to the frequency we are familiar with in terms of cycles per second (hertz). To translate into hertz, you must multiply the frequency contained in the two registers by .059605. This means that the highest frequency the SID can produce is 3904 hertz. The frequency can go as low as zero, but the sound system in your TV set probably won't reproduce a frequency of less than 50 hertz (or 840 to the SID).

The easy way to load the frequency into the two registers is to use this program segment:

- 100 S=54272 : REM (STARTING ADDRESS OF SID CHIP)
- 110 F0=FR/.059605: REM FR=FREQUENCY IN CYC LES/SECOND
- 120 F2=INT(F0/256):F1=F0-256*F2
- 130 POKE S,F1:POKE S+1,F2

If you already know the frequency in terms

Table 2: Map Of Sound Interface Device (SID) Registers ADDRESS REB . C-NOT COVERED IN THIS ARTICLE-ICK-

of the SID chip, you can omit line 110.

The next two registers contain the pulse width of the rectangular pulse wave. This value is a 12-bit number with the eight least significant bits stored in register 2, and the four most significant stored in bits 3-0 of register 3. The four remaining bits of register 3 are not used. If you are using something other than a rectangular pulse wave, you don't have to worry about these two registers.

The pulse width can take a value from 0 to 4095, which corresponds to a range of 0 to 100 percent for the duty cycle. A value of 2048 implies a 50 percent duty cycle and generates a square wave. If these two registers are set to zero and the rectangular pulse wave is selected, no sound will be produced.

The following program segment can be used to set the pulse width.

140 P0=DC*4095/100:REM DC=DUTY CYCLE IN % 15Ø P2=INT(PØ/256):P1=PØ-256*P2 160 POKE S+2,P1:POKE S+3,P2

We should add here that a duty cycle of 10 percent will sound exactly the same as a duty cycle of 90 percent. For some advanced applications the two may sound different, but for a solitary rectangular pulse wave voice, there will be no difference.

Next month we'll get into more complicated music programming.

Apple Input And Menu Screens

Dan Jordan

The screen formatting and menu display techniques demonstrated here will make your Apple programs easier to use.

Menus and formatted screens are two excellent ways to make programs more user-friendly. The two programs included here are simple examples of these techniques.

The "Menu Screen" routine (Program 1) generates a menu and uses a selection bar to help the user choose program functions. To create the

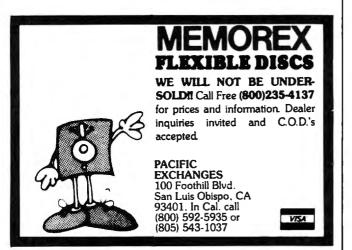

illusion of movement by the selection bar, lines 370–390 blot out the existing bar, and lines 310–340 place a new bar on the next line.

The "Input Screen" routine (Program 2) prints a form on the screen and indicates, by the length of the inverse blank field, the amount of data to be entered. A subroutine can be added to check for field length, if desired. The correction routine (lines 500-570) lets you correct a data section without affecting any other part of the program.

PRINT CHR\$(7) rings a bell, prompting the user to answer a question printed on the screen. Using GET rather than INPUT saves keystrokes in answering these screen prompts (the RETURN key need not be hit to enter data that is input with a GET).

A Beginner's Guide To Typing In Programs

What Is A Program?

A computer cannot perform any task by itself. Like a car without gas, a computer has potential, but without a program, it isn't going anywhere. Most of the programs published in COMPUTE! are written in a computer language called BASIC. BASIC is easy to learn and is built into most computers (on some computers, you have to purchase an optional BASIC cartridge).

BASIC Programs

Each month, COMPUTE! publishes programs for many machines. To start out, type in only programs written for your machine, e.g., "TI Version" if you have a TI-99/4. Later, when you gain experience with your computer's BASIC, you can try typing in and converting certain programs

from one computer to yours.

Computers can be picky. Unlike the English language, which is full of ambiguities, BASIC usually has only one "right way" of stating something. Every letter, character, or number is significant. A common mistake is substituting a letter such as O for the numeral 0, a lowercase I for the numeral 1, or an uppercase B for the numeral 8. Also, you must enter all punctuation such as colons and commas just as they appear in the magazine. Spacing can be important. To be safe, type in the listings exactly as they appear.

Braces And Special Characters

The exception to this typing rule is when you see the braces, such as DOWN. Anything within a set of braces is a special character or characters that cannot easily be listed in a printer. When you come across such a special statement, refer to the appropriate key for your computer. For example, if you have an Atari, refer to the "Atari" section in "How To Type COMPUTE!'s Programs."

About DATA Statements

Some programs contain a section or sections of DATA statements. These lines provide information needed by the program. Some DATA statements contain actual programs (called machine language); others contain graphics codes. These lines are especially sensitive to errors.

If a single number in any one DATA statement is mistyped, your machine could "lock up," or "crash." The keyboard, break key, and RESET (or STOP) keys may all seem "dead," and the screen

may go blank. Don't panic – no damage is done. To regain control, you have to turn off your computer, then turn it back on. This will erase whatever program was in memory, so always SAVE a copy of your program before you RUN it. If your computer crashes, you can LOAD the program and look for your mistake.

Sometimes a mistyped DATA statement will cause an error message when the program is RUN. The error message may refer to the program line that READs the data. The error is still in the DATA

statements, though.

Get To Know Your Machine

You should familiarize yourself with your computer before attempting to type in a program. Learn the statements you use to store and retrieve programs from tape or disk. You'll want to save a copy of your program, so that you won't have to type it in every time you want to use it. Learn to use your machine's editing functions. How do you change a line if you made a mistake? You can always retype the line, but you at least need to know how to backspace. Do you know how to enter inverse video, lowercase, and control characters? It's all explained in your computer's manuals.

A Quick Review

- 1. Type in the program a line at a time, in order. Press RETURN or ENTER at the end of each line. Use backspace or the back arrow to correct mistakes.
- 2. Check the line you've typed against the line in the magazine. You can check the entire program again if you get an error when you RUN the program.
- 3. Make sure you've entered statements in braces as the appropriate control key (see "How To Type COMPUTE!'s Programs" elsewhere in the magazine).

We regret that we are no longer able to respond to individual inquiries about programs, products, or services appearing in COMPUTE! due to increasing publication activity. On those infrequent occasions when a published program contains a typo; the correction will appear on the CAPUTE! page, usually within eight weeks. If you have specific questions about items or programs which you've seen in COMPUTE!, please send them to Readers' Feedback, P.O. Box 5406, Greensboro, NC 27403.

How To Type COMPUTE!'s Programs

Many of the programs which are listed in COMPUTE! contain special control characters (cursor control, color keys, inverse video, etc.). To make it easy to tell exactly what to type when entering one of these programs into your computer, we have established the following listing conventions. There is a separate key for each computer. Refer to the appropriate tables when you come across an unusual symbol in a program listing. If you are unsure how to actually enter a control character, consult your computer's manuals.

Atari 400/800

Characters in inverse video will appear like: The second of Enter these characters with the Atari logo key, [.].

then you see	Туре	See	
(CLEAR)	ESC SHIFT <	R	Clear Screen
(UP)	ESC CTRL -	+	Cursor Up
CDOWN	ESC CTRL =		Cursor Down
(LEFT)	ESC CTRL +		Cursor Left
(RIGHT)	ESC CTRL 8	+	Cursor Right
(BACK S)	ESC DELETE	4	Backspace
(DELETE)	ESC CTRL DELETE		Delete character
(INSERT)	ESC CTRL INSERT	U	Insert character
(DEL LINE)	ESC SHIFT DELETE	D	Delete line
(INS LINE)	ESC SHIFT INSERT		Insert line
(TAB)	ESC TAB		TAB key
(CLR TAB)	ESC CTRL TAB	G	Clear tab
(SET TAB)	ESC SHIFT TAB	0	Set tab stop
(BELL)	ESC CTRL 2		Ring buzzer
(ESC)	ESC ESC	- 4	ESCape key

Graphics characters, such as CTRL-T, the ball character • will appear as the "normal" letter enclosed in braces, e.g. fT1.

A series of identical control characters, such as 10 spaces, three cursor-lefts, or 20 CTRL-R's, will appear as (10 SPACES), 13 LEFT 11, (20 R1, etc. If the character in braces is in inverse video, that character or characters should be entered with the Atari logo key. For example, () means to enter a reverse-field heart with CTRL-comma, (5 m) means to enter five inverse-video CTRL-U's.

Commodore PET/CBM/VIC/64

Generally, any PET/CBM/VIC/64 program listings will contain words within braces which spell out any special characters: I DOWN I would mean to press the cursor down key. I 5 SPACES I would mean to press the space bar five times.

To indicate that a key should be *shifted* (hold down the SHIFT key while pressing the other key), the key would be underlined in our listings. For example, S would mean to type the S key while holding the shift key. If you find an underlined key enclosed in braces (e.g., {10 N}), you should type the key as many times as indicated (in our example, you would enter ten shifted N's). Some graphics characters are inaccessible from the keyboard on CBM Business models (32N, 8032).

For the VIC and 64, if a key is enclosed in special brackets, k > , you should hold down the Commodore key while pressing the key inside the special brackets. (The Commodore key is the key in the lower left corner of the keyboard.) Again, if the key is preceded by a number, you should press the key as many times as indicated.

Rarely, you'll see in a Commodore 64 program a solitary letter of the alphabet enclosed in braces. These characters can be entered by holding down the CTRL key while typing the letter in the braces. For example, {A} would indicate that you should press CTRL-A.

About the quote mode: you know that you can move the cursor around the screen with the CRSR keys. Sometimes a programmer will want to move the cursor under program control. That's why you see all the {LEFT}'s, {HOME}'s, and {BLU}'s in our programs. The only way the computer

can tell the difference between direct and programmed cursor control is the quote mode.

Once you press the quote (the double quote, SHIFT-2), you are in the quote mode. If you type something and then try to change it by moving the cursor left, you'll only get a bunch of reverse-video lines. These are the symbols for cursor left. The only editing key that isn't programmable is the DEL key; you can still use DEL to back up and edit the line. Once you type another quote, you are out of quote mode.

You also go into quote mode when you INSerT spaces into a line. In any case, the easiest way to get out of quote mode is to just press RETURN. You'll then be out of quote mode and you can cursor up to the mistyped line and fix it.

Use the following tables when entering special characters:

VIC And 64

When Yo		- September		When \			C Suer
Read:	Pre	55:	See:	Read:	Pre	35:	See:
[CLR]	SHIFT	CLR/HOME	*	[GRN]	CTRL	6	**
[HOME]	-	CLR/HOME	5	(BLU)	CTRL	7	-
{UP}	SHIFT	CRSR		(YEL)	CTRL	8	
{DOWN}	100	CRSR •		{P1}	n		
{LEFT}	SHIFT	CRSR-		[F2]	12	PACE N	
{RIGHT}		-CRSR -		[F3]	ß		
{RVS}	CTRL	9		{F4}	н	100	
{OFF}	CTRL	0		{F5}	f5		
{BLK}	CTRL	1		[F6]	f6		
(WHT)	CTRL	2		[F7]	£7		
{RED}	CTRL	3		[F8]	f8] .	
[CYN]	CTRL		14	4	•		
{PUR}	CTRL	5		<u>†</u>	SHIFT	1	m

All Commodore Machines

Clear Screen {CLR}	Cursor Left { LEFT}
Home Cursor { HOME}	Insert Character [INST]
Cursor Up {UP}	Delete Character { DEL}
Cursor Down { DOWN}	Reverse Field On {RVS}
Cursor Right {RIGHT}	Reverse Field Off { OFF }

Apple II / Apple II Plus

All programs are in Applesoft BASIC, unless otherwise stated. Control characters are printed as the "normal" character enclosed in braces, such as [D] for CTRL-D. Hold down CTRL while pressing the control key. You will not see the special character on the screen.

Texas Instruments 99/4

The only special characters used are in PRINT statements to indicate where two or more spaces should be left between words. For example, ENERGY {10 SPACES} MANAGE-MENT means that ten spaces should be left between the words ENERGY and MANAGEMENT. Do not type in the braces or the words 10 SPACES. Enter all programs with the ALPHA LOCK on (in the down position). Release the ALPHA LOCK to enter lowercase text.

Modifications Or Corrections To Previous Articles

VIC Worm Of Bemer

The listing for the VIC version of this game from the April issue (p. 74) contains Commodore 64 color codes which are not available on the VIC. These cause no serious problems, but the £63 or £83 character should be omitted in lines 7715, 7730, and 10000.

Super Directory For 64 And IBM

Commodore 64 users have found that using "Super Directory" (Program 1, p. 173) from the April issue to load and run programs can cause problems if the program selected uses the BASIC function RND. An overflow error will be encountered because Super Directory alters a memory location used in calculating random numbers. Brian T. Bennett has discovered that the problem can be solved by changing line 1150 to:

1150 POKE 139.128:GOTO 5000

The IBM version (Program 4, p. 176) cannot be used to load and run programs from a disk with the write-protect notch covered. This is due to the way DOS handles the Write-Protect Error. Note also that the program as presented will work only with DOS 2.0 or 2.1.

TI Mozart Machine

Music aficionados may have detected a sour note in the tunes played by the TI version of this program from the January issue (Program 4, p. 168). The solution is to change the next to the last DATA element in line 480 from 287 to 587. Thanks to Kevin M. Norberg for this correction.

Atari Roader Improvements

Mike La Fave offers the following revision to this game from the March issue (Program 3, p. 70) to allow you to steer your racer with a joystick instead of the keyboard:

220 P=STICK(0):IF P=11 THEN N=N-1:GOTO 240 230 IF P=7 THEN N=N+1

Also, Keith Christleib suggests the following additions to include an engine sound as the car speeds down the track:

201 SOUND 3,135,2,9 315 SOUND 3,0,0,0

64Key Relocated

Reader Mike Levesque notes that the "64Key" program from the February issue (p. 160) uses the same area of memory as the DOS Wedge program supplied with the 1541 demo disk. To use these two valuable utilities together, he suggests changing the following lines:

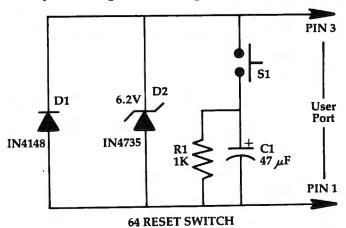

20 FOR I=51789 TO 51967 50 IF X<>23734 THEN PRINT "THERE IS AN ERROR IN YOUR DATA STATEMENTS":END 60 PRINT"SYS 51789 TO ACTIVATE":END

Next, change the DATA element 205 to 202 in the following lines: 100, 120, 130, 140, 150, 190, 220, 300, and 320. Finally, remove the ,0 from the end of line 430 and delete line 440. These changes relocate 64Key to the area immediately above the Wedge, allowing the two to coexist in harmony and still leaving locations 49152–51788 free for other uses.

64 Explorer RESET Switch

Columnist Larry Isaacs recommends a revision of RESET switch circuit for the 64 featured in his March column (p. 172). Larry based his design on the schematic diagram of the 64 included in the *Programmer's Reference Guide*. However, the actual circuitry in the 64 has since been slightly modified and, as a result, it is no longer safe to ground the RESET line directly. Although Larry has used his switch for several months without incident, it presents some risk of damaging the chips inside the computer, and you should consider this before attempting to use the switch on your computer.

As an alternative, Lester Iwamasa of Custom Concepts, who pointed out the danger of using the original circuit, has provided the following circuit which performs a RESET without the possibility of damage to the computer:

If you're not up to building this circuit yourself, you can obtain it for \$21.95, plus \$2.00 shipping, from:

Custom Concepts 30117 3rd Pl. SW Federal Way, WA 98003

The Automatic Proofreader For VIC, 64, And Atari

Charles Brannon, Program Editor

At last there's a way for your computer to help you check your typing. "The Automatic Proofreader" will make entering programs faster, easier, and more accurate.

The strong point of computers is that they excel at tedious, exacting tasks. So why not get your computer

to check your typing for you?

With "The Automatic Proofreader" nestled in your VIC-20, Commodore 64, or Atari computer, every line you type in will be verified. It displays a special code, called a *checksum*, at the top of the screen. The checksum, either a number (VIC/64) or a pair of letters (Atari), corresponds to the line you've just typed. It represents every character in the line summed together. A matching code in the program listing lets you compare it to the checksum which the Proofreader displays. A glance is all it takes to confirm that you've typed the line correctly.

Entering The Automatic Proofreader

Commodore (VIC/64) owners should type in Program 1. Program 2 is for Atari users. Since the Proofreader is a machine language program, be especially diligent. Watch out for typing extra commas, or a letter O for a zero, and check every number carefully. If you make a mistake when typing in the DATA statements, you'll get the message "Error in DATA statements" when you RUN the program. Check your typing and try again.

When you've typed in The Automatic Proofreader, SAVE it to tape or disk at least twice before running it for the first time. If you mistype the Proofreader, it may cause a system crash when you first run it. By SAVEing a copy beforehand, you can reLOAD it and hunt for your error. Also, you'll want a backup copy of the Proofreader because you'll use it again and again every time you enter a program from COMPUTE!.

When you RUN the Proofreader, the program will be POKEd safely into memory, then it will activate itself. If you ever need to reactivate it (RUN/STOP—RE-STORE or SYSTEM RESET will disable it), just enter the command SYS 886 (VIC/64) or PRINT USR(1536) for the Atari.

Using The Proofreader

Now, let's see how it works. LIST the Proofreader program, move the cursor up to one of the lines, and press RETURN. If you've entered the Proofreader correctly, a checksum will appear in the top-left corner of your screen.

Try making a change in the line and hit RETURN. Notice that the checksum has changed. All VIC and 64 listings in COMPUTE! now have a number appended to the end of each line, for example, :rem 123. Don't

enter this statement. It is just for your information. The rem is used to make the number harmless if someone does type it in. It will, however, use up memory if you enter it, and it will cause the checksum displayed at the top of the screen to be different, even if you entered the rest of the line correctly.

The Atari checksum is found immediately to the left of each line number. This makes it impossible to type in the checksum accidentally, since a program line must start with a number.

Just type in each line (without the printed checksum), and check the checksum displayed at the top of the screen against the checksum in the listing. If they match, go on to the next line. If they don't, there's a mistake. You can correct the line immediately, instead of waiting to find the error when you RUN the program.

The Proofreader is not picky with spaces. It will not notice extra spaces or missing ones. This is for your convenience, since spacing is generally not important. Occasionally proper spacing is important, but the article describing the program will warn you to be careful in these cases.

Nobody's Perfect

Although the Proofreader is an important aid, there are a few things to watch out for. If you enter a line by using abbreviations for commands, the checksum will not match up. This is because the Proofreader is very literal: It looks at the individual letters in a line, not at tokens such as PRINT. There is a way to make the Proofreader check such a line. After entering the line, LIST it. This makes the computer spell out the abbreviations. Then move the cursor up to the line and press RETURN. It should now match the checksum. You can check whole groups of lines this way. Atari users should beware of using? as an abbreviation for PRINT they're not the same thing in the Proofreader's eyes.

The checksum is a sum of the ASCII values of the characters in a line. VIC and 64 owners may wonder why the numbers are so small, never exceeding 255. This is because the addition is done only in eight bits. A result over 255 will roll over past zero, like an odometer past 99999. On the Atari, the number is turned into two letters, both for increased convenience and to make the Proofreader shorter. For the curious, the letters correspond to the values of the left and right nybbles added to 33 (to offset them into the alphabet). This number is then stored directly into screen memory.

Due to the nature of a checksum, the Proofreader will not catch all errors. Since 1+3+5=3+1+5, the Proofreader cannot catch errors of transposition. In fact, you could type in the line in any order, and the Proofreader wouldn't notice. Anytime the Proofreader seems to act strange, keep this in mind. Since the ASCII values of the number 18 (49 + 56) and 63 (54 + 51) both equal 105, these numbers are equal according to the Proofreader. There really is no simple way to catch these kinds of errors. Fortunately, the Proofreader will catch the majority of the typing mistakes most people make.

If you want the Proofreader out of your way, just press SYSTEM RESET or RUN/STOP—RESTORE. If you need it again, enter SYS 828 (VIC/64) or PRINT USR(1536) (Atari). You must disable the Proofreader before doing any tape operations on the VIC or 64.

Hidden Perils

The Proofreader's home in the VIC and 64 is not a very safe haven. Since the cassette buffer is wiped out during tape operations, you need to disable the Proofreader with RUN/STOP—RESTORE before you SAVE your program. This applies only to tape use. Disk users or Atari owners have nothing to worry about.

Not so for VIC and 64 owners with tape drives. What if you type in a program in several sittings? The next day, you come to your computer, LOAD and RUN the Proofreader, then try to LOAD the partially completed program so you can add to it. But since the Proofreader is trying to hide in the cassette buffer, it is wiped out!

What you need is a way to LOAD the Proofreader after you've LOADed the partial program. The problem is, a tape load to the buffer destroys what it's supposed to load

After you've typed in and RUN the Proofreader, enter the following lines in direct mode (without line numbers) exactly as shown:

```
A$="PROOFREADER.T": B$="[10 SPACES]": FOR
   X = 1 TO 4: A$=A$+B$: NEXTX
```

FOR X = 886 TO 1018: A\$=A\$+CHR\$(PEEK(X)): NEXTX

OPEN 1,1,1,A\$:CLOSE1

After you enter the last line, you will be asked to press record and play on your cassette recorder. Put this program at the beginning of a new tape. This gives you a new way to load the Proofreader. Anytime you want to bring the Proofreader into memory without disturbing anything else, put the cassette in the tape drive, rewind, and enter:

OPEN1:CLOSE1

You can now start the Proofreader by typing SYS 886. To test this, PRINT PEEK(886) should return the number 173. If it does not, repeat the steps above, making sure that A\$ ("PROOFREADER.T") contains 13 characters and that B\$ contains 10 spaces.

You can now reload the Proofreader into memory whenever LOAD or SAVE destroys it, restoring your personal typing helper.

Incidentally, you can protect the cassette buffer on the Commodore 64 with POKE 178,165. This POKE should work on the VIC, but it has caused numerous problems, probably due to a bug in the VIC operating system. With this POKE, the 64 will not wipe out the cassette buffer during tape LOADs and SAVEs.

64 Data Base

ABS Software has announced *Compufile*, a relative data base for the Commodore 64.

Compufile has 20 user-defined fields, user-defined reports, multiple levels of search and sort abilities, and a user-changeable format. Multiple data bases can be stored on a single disk. The system will automatically correct many error conditions, and can deliver records in sequential file form so they can be accessed by word processors.

The program is menudriven, and runs in machine language. A directory of all data bases contained on a disk is automatically displayed on the screen at the start. More than 50 pages of documentation are available, and templates are included to aid in creating general interest data bases.

Compufile sells for \$39.95 on disk.

Apple Time Management System

Creative Peripherals Unlimited, Inc., has announced Time-Trax, The Time Management System for

the Apple II, II +, and IIe computers.

The system is a time- and date-oriented appointment and scheduling program which plugs into the computer's game port and provides another port for game paddles. It is powered by the computer when turned on and by two AA batteries (not included) when the computer is off.

Up to 311 entries can be made in a single month, and up to 99 entries can be included on a single day. Important entries can be flagged. Annual entries can be made that will appear every year on the scheduled day and time, such as birthdays, policy renewals, and anniversaries. The program has search features, and will allow printouts of information.

Time-Trax is available for \$99.95.

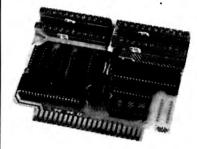

C.P.U., Inc. 1606 S. Clementine Anaheim, CA 92802 (800) 854-8021 nationwide (800) 432-7268 California

Atari Keyboard Graphics Labels

Graph-Fix, a set of 29 graphics labels for Atari keyboards, is available from Dovestar Creative Concepts.

The Mylar-coated labels are applied to the front face of each graphics key and fit all Atari models. They are intended to

NEW! Universal Input/Output Board for VIC-20/64

- 16 channel 8-bit A/D converter with 100 microsecond sampling time.
- 1 D/A output.
- 16 high voltage/high current discrete outputs.
- 1 EROM socket.
- Use multiple boards for additional channels up to 6 boards.

VIC-20 uses MW-311V \$205,00 CBM-64 uses MW-311C . . . \$225.00

MW-302: VIC-20/64 Parallel Printer Interface.

Works with all centronics type parallel matrix & letter printers and plotters—Epson, C.Itoh, Okidata, Nec, Gemini 10, TP-I Smith Corona, and most others. Hardware driven; works off the serial port. Quality construction: Steel DIN connectors & shielded cables. Has these switch selectable options: Device 4, 5, 6 or 7; ASCII or PET ASCII; 7-bit or 8-bit output; upper & lower case or upper only. Recommended by PROFESSIONAL SOFTWARE for WordPro 3 Plus for the 64, and by City Software for PaperClip.

Versatile Print Package For Apple

Brøderbund Software has introduced *The Print Shop*, a diskbased software package that enables you to write, design, and print greeting cards, stationery, letterheads, signs, and even banners.

The menu-driven program requires an Apple II + or Apple IIe with at least 48K memory. The Print Shop supports many popular printers, including the Epson, Apple Dot Matrix, Imagewriter, and C. Itoh Prowriter.

Messages can be written in one of eight different type styles available in two sizes, and in solid, outline, and three-dimensional formats. There are nine border designs, ten abstract patterns, and dozens of pictures and symbols to use.

There is a built-in graphics editor with which you can create your own designs. With only one pass through a printer, *The*

Print Shop will produce a greeting card with inside and outside messages. The program will let you print out your writing with proportional spacing. Custom letterheads with personalized logos, full-page signs with graphics, banners of unlimited length with extra-large letters—all are available with the package.

The Print Shop comes with an assortment of pin-feed paper and matching envelopes in various colors, and has a suggested retail price of \$49.95. Paper refills are available for \$14.95.

Bróderbund Software 17 Paul Drive San Rafael, CA 94903 (415) 479-1170

Software Buyers' Guide

The fourth edition of the Software Express, a 320-page guide with more than 800 programs for Apple, Atari, Commodore 64, VIC-20, and IBM PC and PCjr computers, is available from SKU, Inc.

The guide includes listings and descriptions of the best-selling and highest-rated software. The new edition has a section on computer peripherals and accessories, a glossary of 100 computer and data processing terms, manufacturer coupons worth \$100 in discounts, and six

tutorial articles on what to look for when buying software.

Software Express, published quarterly, is available for \$9.95 per copy and on a subscription basis for \$18.95 a year.

SKU, Inc. 2600 Tenth Street Berkeley, CA 94710 (415) 848-0802

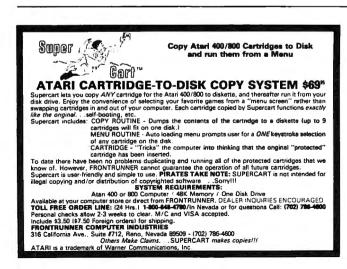

Educational Software For Atari, Commodore

Gladstone Electronics, Inc., has released "Diskovery" Reading Words, four software packages designed to help children increase their learning rate and improve school work, and two programs that help develop math skills.

The Alphabet Factory and Match-Up are designed for children from three to eight years old. The Word Bird and Time Zone are offered for children from six to twelve years old. The series of programs uses animated graphics, color, and sound to help motivate students in learning to read. An arcade-game format is used in each.

Adding Machine and Take-Away Zoo are the two math skill development packages.

Each of the programs is available on disk for \$29.95 for Com-

modore 64 and Atari 400 and 800 computers.

Gladstone Electronics, Inc. 1585 Kenmore Avenue Buffalo, NY 14217 (716) 874-5510

TI-99/4A Cartridge **Expander**

Navarone Industries produces the Cartridge Expander, which plugs into the game port of the TI-99/4A and allows up to three cartridges to be plugged in at one time.

The expander also contains a built-in reset button and a select switch that lets you change from one cartridge to another without plugging and unplugging cartridges.

The Cartridge Expander is available for \$39.95.

Navarone Industries 510 Lawrence Expressway #800 Sunnyvale, CA 94086 (408) 866-8579

PCjr, Atari Audio **Tutorials**

Tutorials for new owners of PCjr and Atari 600XL and 800XL computers are available on audio cassette from FlipTrack Learning Systems.

How To Operate the IBM PCjr has two audio cassettes. The first cassette guides the user through start-up procedures; keyboard familiarization; simple BASIC programming; and the PCjr's color, sound, graphics, and mathematical capabilities, as well as cassette tape storage and use of a printer.

The second cassette includes information on how to manage disk storage and files with DOS. The lesson covers directory display, using tree-structured directories, checking disk storage space, and copying the formatting disks, as well as copying,

renaming, and erasing files, and batch processing.

How To Operate the Atari 600XL and 800XL Home Computer is a tutorial on one audio cassette and one data cassette. The package teaches start-up procedures, keyboard familiarization, and how to take advantage of the Atari's color, sound, graphics, and mathematical capabilities. Step-by-step BASIC programming is also taught.

The tutorials use the Flip-Track cassette format, which permits the user to branch into optional special interest areas with the flip of a cassette.

The PCjr tutorial sells for \$39.95, and the Atari tutorial is available for \$19.95. They operate on standard cassette players.

FlipTrack Learning Systems 999 Main Suite 200 Glen Ellyn, IL 60137 (312) 790-1117

Four Educational Games For 64, Atari

Spinnaker Software has four new educational software titles, two for the Commodore 64, one for the Atari, and one for both computers.

Grandma's House, directed toward children four to eight, is a game for the 64 and the Atari that lets youngsters create and furnish their own playhouse. The program helps children learn to design and create, and is available on disk for \$34.95.

Ranch, ages five to ten, is available on cartridge for the 64. The program lets a player create and animate wild west scenes. Starting with a blank screen, the player populates it with a range of people, objects, and animals. You can copy, color, move, erase, or animate shapes. Ranch is

priced at \$39.95.

Aegean Voyage, for ages eight to adult, has players navigate ships through the Aegean Sea, docking at islands to collect clues from the Oracles. By connecting the clues, players can find treasure. The game introduces many names from Greek mythology and emphasizes strategic thinking and deductive reasoning. The program is available for \$39.95 on cartridge.

Adventure Creator, ages 12 to adult, lets players learn how to design an adventure game. Players have up to 100 rooms to fill with mazes, creatures, hazards, and treasures. The program also can have the computer design the world for the player. Adventure Creator is available on cartridge for the Atari computer for \$39.95.

Spinnaker Software 215 First Street Cambridge, MA 02142 (617) 868-4700

Atari, Apple Old West Game

Strategic Simulations, Inc., has created *Rails West*, a simulation of the Western railroad development of the late 1800s, for Apple and Atari computer systems.

Up to eight players may participate, choosing the scenario and level of play, among other options. Menus guide each player through such business decisions as buying and selling stocks and bonds, applying for loans, and floating securities. Economic conditions ranging from boom times to panics are important factors throughout the game.

Rails West is available on disk for \$39.95.

Strategic Simulations, Inc. 883 Stierlin Road Building A-200 Mountain View, CA 94043-1983 (415) 964-1353

The new Volksmodem adapter cable and software allow Atari users to access telecommunications services via a game port.

Atari Apple Ed Telecommunications Software Package

A Volksmodem adapter cable and software which will allow Atari computer users to gain access to telecommunications services via the game port are now available from Anchor Automation.

The new F Cable allows direct connection of the Volksmodem, a \$79.95 telecommunications modem produced by Anchor, to the Atari 400, 600, 800, and 1200 microcomputers through game port 2 without using an Atari Model 850 Interface Unit.

The package has a suggested retail price of \$39.95 and includes adapter cable with electronics, one software tape cassette, and one 6-foot telephone cable.

Anchor Automation, Inc. 6913 Valjean Avenue Van Nuys, CA 91406 (213) 997-6493

COMPUTE! The Resource.

Apple Educational Software

Letters and First Words is the latest program in the "Kids' Corner" line of software by C & C Software. The package contains three programs that help children learn to identify letters, recognize their associated sounds, and begin to spell simple words.

Animated graphics displays introduce letter recognition skills in A-B-C, the first program on the disk. The sound of the letter and both upper- and lowercase letters are shown.

Letter Sounds helps children strengthen their association of sounds with individual letters. Children pick the object that has the correct initial consonant, middle short vowel, or final consonant sound, depending on the skill level.

In the program Building Words, children learn how letters and their sounds work together to form simple words. Children progress from selecting a word to match a picture, to providing letters to complete the word. At the highest skill level, they are spelling simple words.

Letters and First Words is recommended for children in preschool through second grade. The complete package, including disk for Apple II + or Apple IIe computers, documentation, and keyboard labels, is available for \$40. Backup disks are available for \$10.

C & C Software 5713 Kentford Circle Wichita, KS 67220 (316) 683-6056 encounter aliens and must uncover their secret plans.

Eleven interrelated programs on four disks make up the game, which includes arcade segments and a series of puzzles as a part of the adventure.

Jupiter Mission sells for \$50.

Microcomputer Games, Inc. 4517 Harford Road Baltimore, MD 21214 (301) 254-9200 printer, undelete files, and a variety of other programming functions.

Disk O' Utilities sells for \$12.95 (add \$1 for shipping and handling).

COMPUTE!'s FREE Reader Information Service

Use these cards to request FREE information about the products advertised in this issue. Clearly print or type your full name and address. Only one card should be used per person. Circle the numbers that correspond to the key number appearing in the advertisers index.

Send in the card and the advertisers will receive your inquiry. Although every effort is made to insure that only advertisers wishing to provide product information have reader service numbers, COMPUTEL cannot be responsible if advertisers do not provide literature to readers.

Please use these cards *only* for subscribing or for requesting product information. Editorial and customer service inquiries should be addressed to: COMPUTEI, P.O. Box 5406, Greensboro, NC 27403. Check the expiration date on the card to insure proper handling.

Use these cards and this address only for COMPUTE!'s Reader Information Service. Do not send with payment in any form.
