Nyxoah

Our History

Nyxoah

A global company with over 150 employees

Improving Lives Through Restful Nights

A patient-centric solution TODAY...

- ▶▶ Single incision procedure
- ▶▶ Leadless and battery-free
- ▶▶ Full-body 1.5T and 3T MRI compatible
- ▶▶ Bilateral stimulation
- ▶▶ Indicated for both CCC and non-CCC
- ▶▶ Scalable platform

... An intelligent medtech solution TOMORROW

Implantable Stimulator

Activation Chip and Disposable Patch

Charging Unit

Nyxoah™

A Patient-Centric Approach to Innovation

Maximize therapy efficacy

- Integrated sensors as a baseline for future developments
 - Position sensors – Accelerometer and gyroscope
 - Sound sensor – Microphone
- Incorporating learnings from physicians
 - NAPS team: R&D, clinical, T&E, Physicians

Patient ownership and compliance

- Patient Feedback App
- Patient Remote Control allowing stimulation adjustments

Patient driven innovation

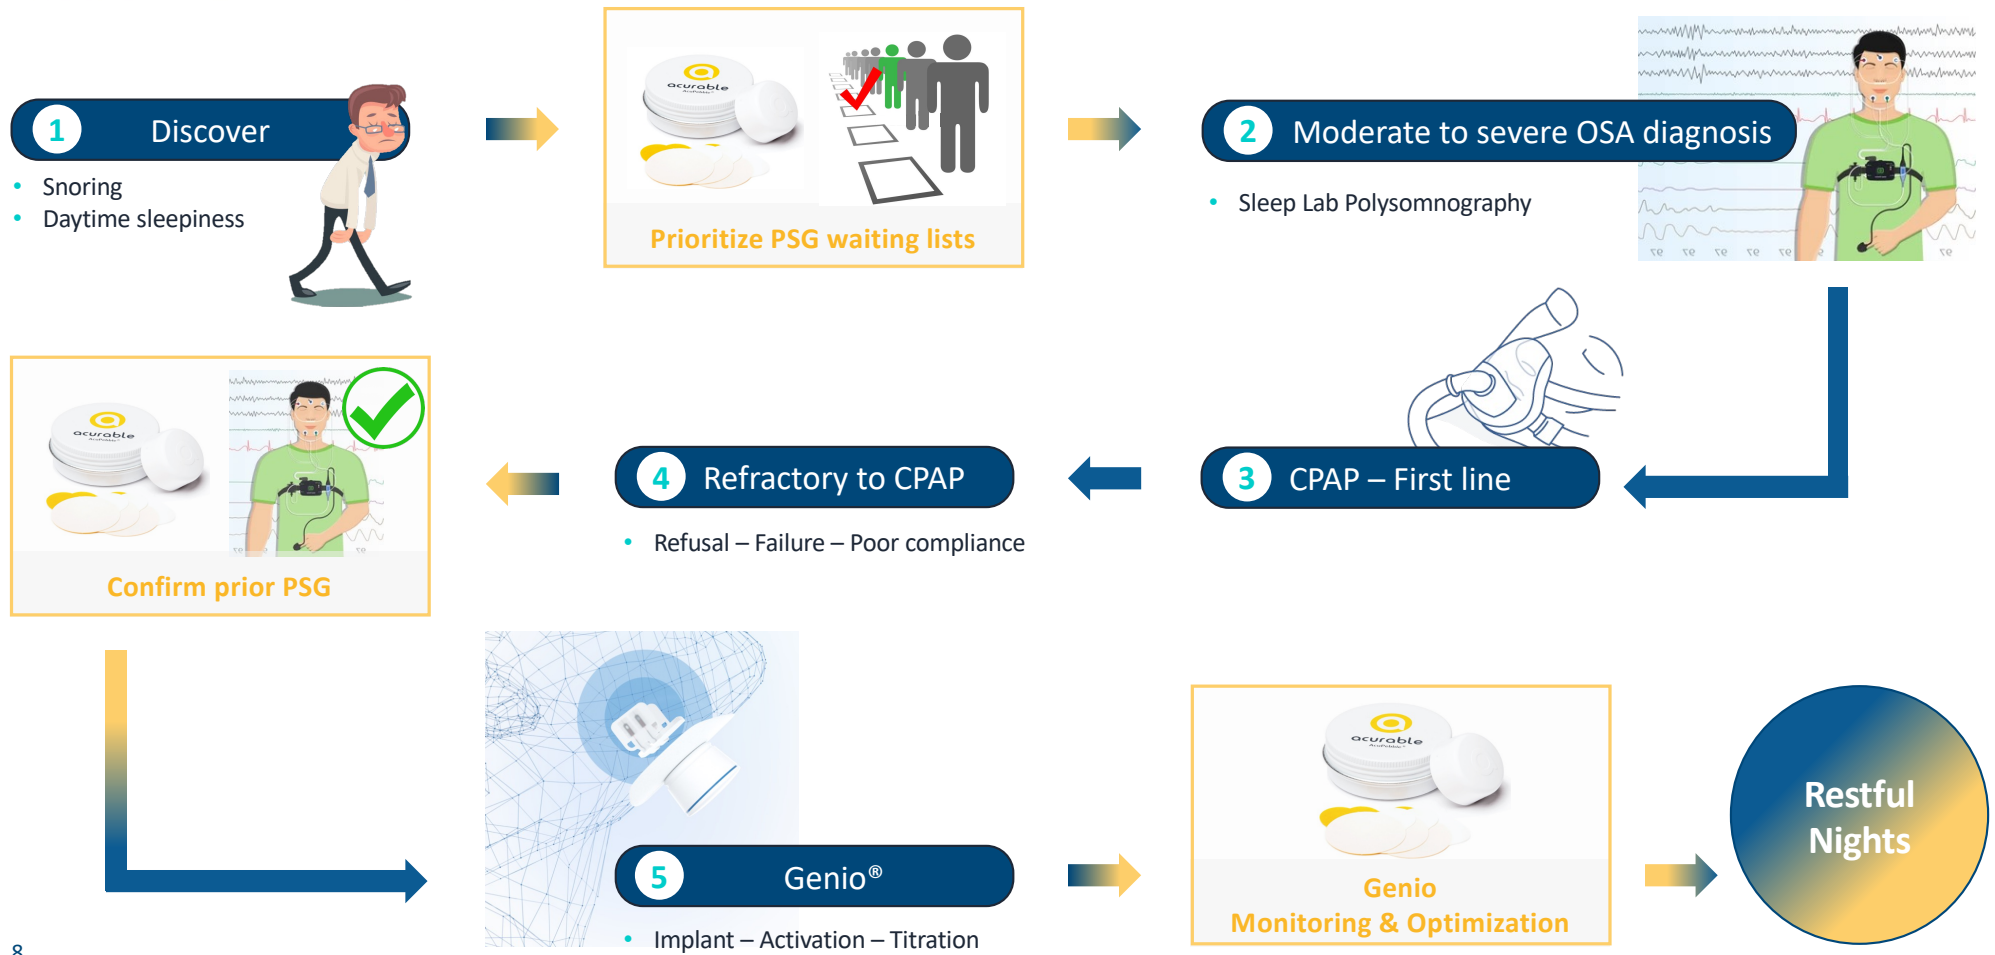

- Implant for life / Scalable technology platform
- Novel treatment
 - Complete Concentric Collapse
 - Ansa Cervicalis

Nyxoah

The Nyxoah "Care4" Program

Building an OSA Ecosystem

Kill Two Birds with One Stone...

AcuPebble® SA1 00

Emilio Sanz – Chief Executive Officer, Acurable

Our solution: AcuPebble® SA100

The first medical device to obtain the CE mark for the **automated diagnosis** of obstructive sleep apnoea

- ▶ Over a decade of research

Imperial College
London

- ▶ Clinically validated accuracy

BMJ Open

- ▶ Top technology awards

XPRIZE
AWARD

- ▶ Supported by NHS England

NHS
The AHSN Network

AcuPebble[®] SA100 makes diagnosis simple

Using AcuPebble SA100 is as simple as **peeling off an adhesive and putting it on**

AcuPebble sensor

Size 2.9 cm
Weight 7 gr

Patient

Fix to neck exterior using
medical adhesive

Mobile

Wireless transfer to
nearby mobile device

Cloud

Upload to secure data
platform for analysis

Doctor

Remote access to patient's
results via web app

Clinically validated accuracy

POWERED CLINICAL TRIAL (150 adult patients)

- ▶ Proved sleep apnoea diagnosis **equivalence to ambulatory gold-standard** (polygraphy followed by specialist interpretation).
- ▶ Validated **AHI and ODI based diagnosis** for 3% and 4% desaturation criteria with very high accuracy (**94% PPV, 98% NPV**)⁽¹⁾
- ▶ **Proved usability** with 100% of patients able to complete the test without training or assistance.
- ▶ Results published in **BMJ Open**.

⁽¹⁾ Trial completed at Royal Free London hospital in 2019. Results published in BMJ Open
PPV = Positive Predictive Value; NPV = Negative Predictive Value.

Detailed study report available in minutes

DIAGNOSIS DETAILS

- ▶ Overall diagnosis (test result and severity).
- ▶ **AHI and ODI** diagnostic indexes for 3% and 4% desaturation criteria, using estimation of sleep time.
- ▶ Classification of apnoea events (obstructive vs. central, apnoea vs. hypopnea)

ADDITIONAL INFORMATION

- ▶ Comprehensive **snoring analysis** (sleep time snoring and severity).
- ▶ Respiratory and cardiac features analysis.
- ▶ Oxygen saturation analysis (via integration with oximeter)

NUMBER: DAWN-1
DATE OF BIRTH: 10/02/2022

acurable

TEST RESULT

THE PATIENT HAS MODERATE SLEEP APNOEA

This diagnosis follows the AASM criteria version 2.5

CLINICIAN COMMENTS
No comments entered

DIAGNOSIS

DIAGNOSTIC INDEX	SEVERITY	EVENTS/HOUR
3% desaturation		
AHI3	MODERATE	21
ODI3	MODERATE	19
4% desaturation		
AHI4	MODERATE	21
ODI4	MODERATE	19

EVENTS/HOUR: 5 (NORMAL), 15 (MILD), 30 (MODERATE), 45 (SEVERE)

DEFINITIONS

- AHI3: Average number of events per hour with events defined as per AASM version 2.5
- ODI3: Average number of 3% oxygen desaturation events per hour.
- AHI4: Average number of events per hour with events defined as per AASM version 2.5 but with desaturation threshold at 4%.
- ODI4: Average number of 4% oxygen desaturation events per hour.

AcuPebble SA100 Study report CE 2022 Acurable Ltd Confidential Generated on: 11 Feb 2022 12:41 Page 2 of 5

Based on acoustic sensing

HOW IT WORKS

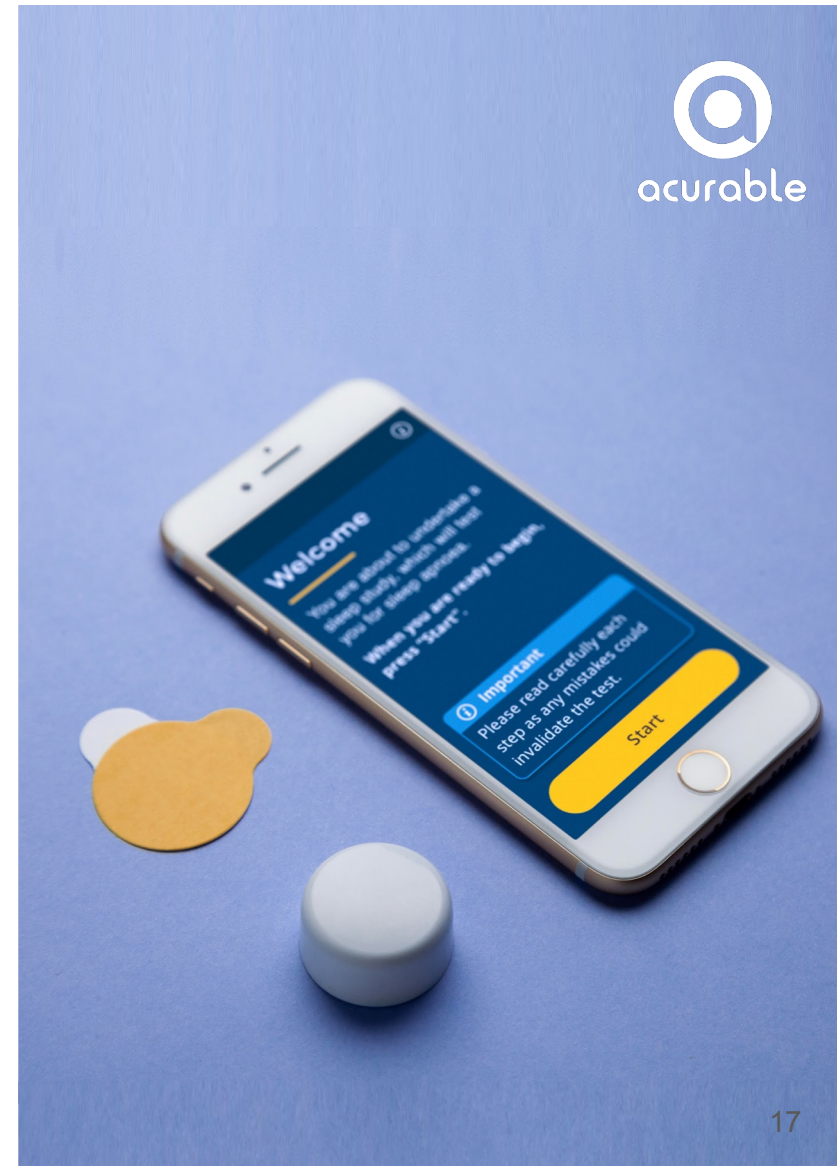

1. Physiological body processes such as the respiratory and cardiac functions generate **sounds rich in information**.
1. **AcuPebble sensor records** these internal body sounds which are transferred to a mobile device wirelessly.
1. Sophisticated signal processing **algorithms automatically extract with high accuracy physiological biomarkers** which are subsequently used for sleep apnoea diagnosis.

Most common use cases

USE CASES

- ▶ **Diagnosis/Screening** of patients for sleep apnoea treatment
- ▶ **Titration** of therapeutic devices to achieve optimal adjustment
- ▶ **Monitoring** of treatment to track patient evolution and improve compliance

Benefits AcuPebble® SA100

AcuPebble SA100 is a valid alternative to the ambulatory gold-standard with 4 key advantages:

- ▶ **Automated:** provides an accurate report with no manual interpretation needed in minutes.
- ▶ **Efficient:** requires fewer resources and saves valuable clinician time.
- ▶ **Easy to use:** no training required and instructions in the accompanying mobile app.
- ▶ **Comfortable:** ensures a more natural night's sleep at home for the patient.

Hypoglossal Nerve Stimulation and the Need for CPAP Alternatives

Prof. Dr. med. Joachim T. Maurer
Division of Sleep Medicine
Department of ORL-HNS, University Hospital Mannheim

Conflict of interest – 36 months

- University Hospital Mannheim: Contracts with Inspire, LivaNova, Nyxoah, Medel
- J.T. Maurer: Honoraria for presentations and/or surgical training from Inspire, LivaNova, Neuwirth Med. Products, Nyxoah

CPAP as new treatment for OSA

Colin Sullivan invented CPAP in 1981 to bridge the time gap until UPPP could be performed.

Today less than 500 g!

Immediate CPAP effect - 1986 in Marburg

Thanks to HF Becker, Marburg/Hamburg

Cardiovascular morbidity and mortality in OSA

n=1387

Reduced morbidity and mortality, if regularly used (Marin JM et al 2005)
3,3 h/night are not enough (McEvoy et al 2017)

Cardiovascular mortality in elderly patients with OSA

AHI ≥ 30 , n=173

AHI 15-29, n=108

CPAP therapy ≥ 4 h, n=503

Controls AHI < 15, n=155

Martinez-Garcia et al., AJRCCM, 2012)

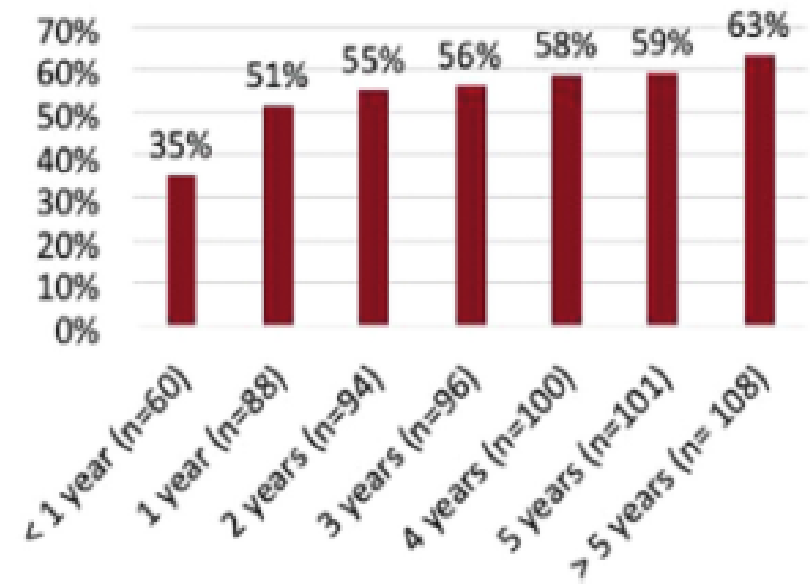

Are PAP and MAD used sufficiently?

CPAP Abandonment Rate
(n=835)

OA Abandonment Rate
(n=171)

Reasons for CPAP failure (n=156)

What to do if PAP and / or MAD are not successful?

- Eliminate the obstacles → Nasal surgery
- Add another treatment → MAD + Palatal surgery
- Switch to alternative treatment → MMA, TE + palatal surgery

- Functional treatment using hypoglossal nerve stimulation

Neurostimulation: When and when not?

„Normal“ anatomy

Impaired function

Concepts of neurostimulation in OSA

- Efferent neurostimulation
 - Active AP-opening by advancement of tongue and soft palate
 - Circumferential stiffening of pharyngeal wall by tracheal/laryngeal caudal tug
- Afferent neurostimulation
 - Improving muscle responsiveness to negative pressure

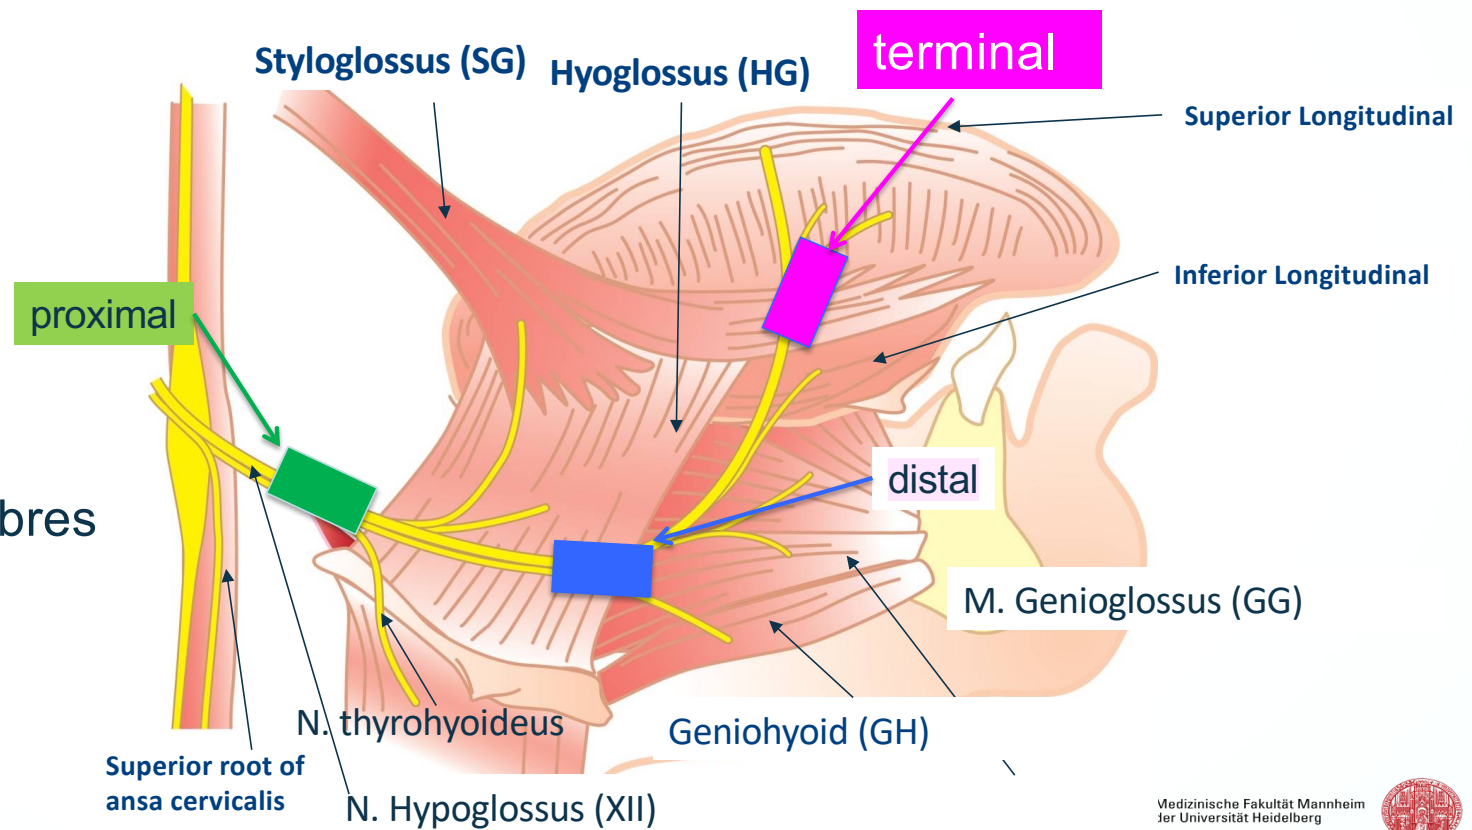

Hypoglossal nerve stimulation: Opening the airway in an antero-posterior dimension

Lateral

- proximal
- distal

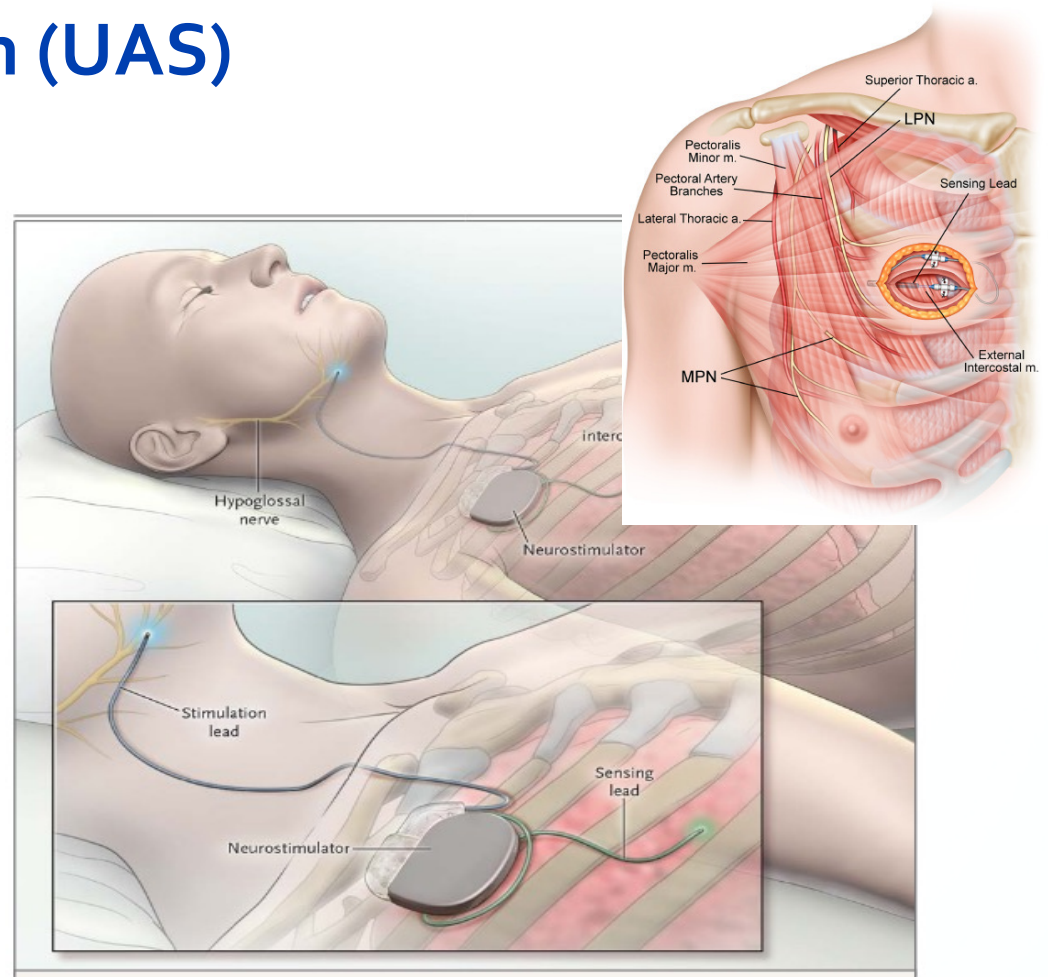

Median

- terminal fibres

Upper Airway Stimulation (UAS)

- Distal selective stimulation
- Exclusion of retractor branches
- Unilateral
- Battery implanted
- Fixed stimulation settings for entire night

Genio (Nyxoah)

- Bilateral stimulation
- External battery
- MRI full body (3 Tesla) scan is possible
- Approved for complete concentric collapse in 2021
- Fixed stimulation settings for entire night

Challenge in hypoglossal nerve stimulation

- Long-term data is needed
- Better predictors of response required
- Self-adapting stimulation parameters according to varying needs required
 - night-to night variability, body position, sleep stage
- Implants usable for sensing and treatment adjustment

Conclusion

- CPAP is standard of care in OSA treatment for any severity
- Oral appliances are possible in mild to moderate OSA
- PAP and MAD fail long-term use in appr. 50% of patients
- Hypoglossal nerve stimulation is indicated for moderate to severe OSA and PAP-failure
- Auto-adjusting stimulation is awaited by the medical community

Bilateral stimulation of the hypoglossal nerve

Prof. Dr. Clemens Heiser, M.D., MHBA, PHD

Department of Otorhinolaryngology, Head and Neck Surgery

Somnology (DGSM), sleep physician, allergy, plastic surgery

Conflict of interest

My conflicts of interest related to the following companies within the last 12 months:

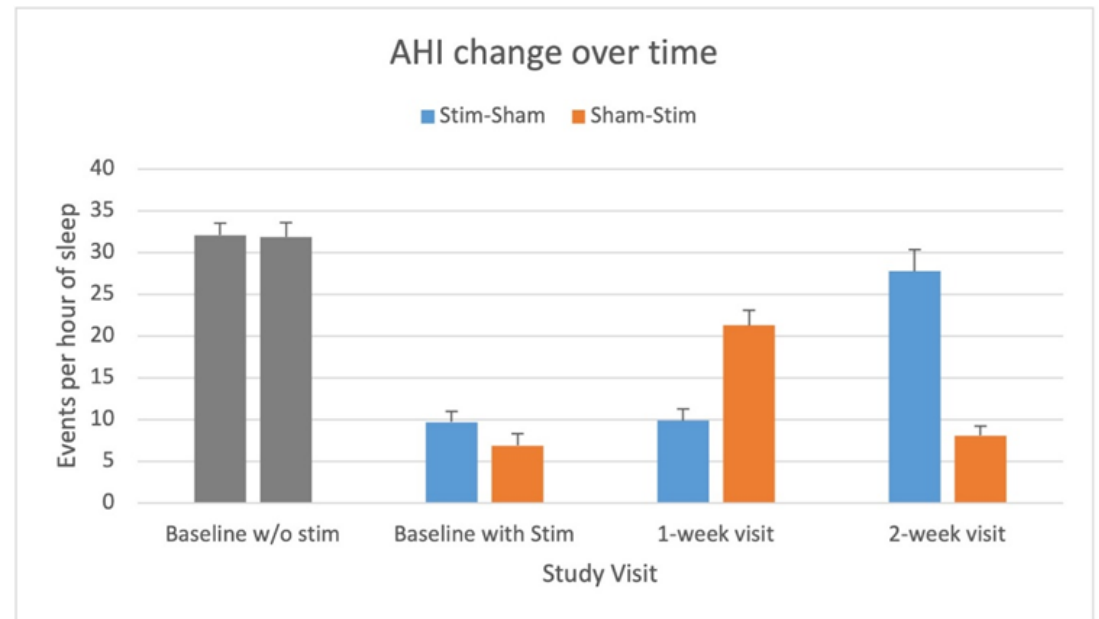

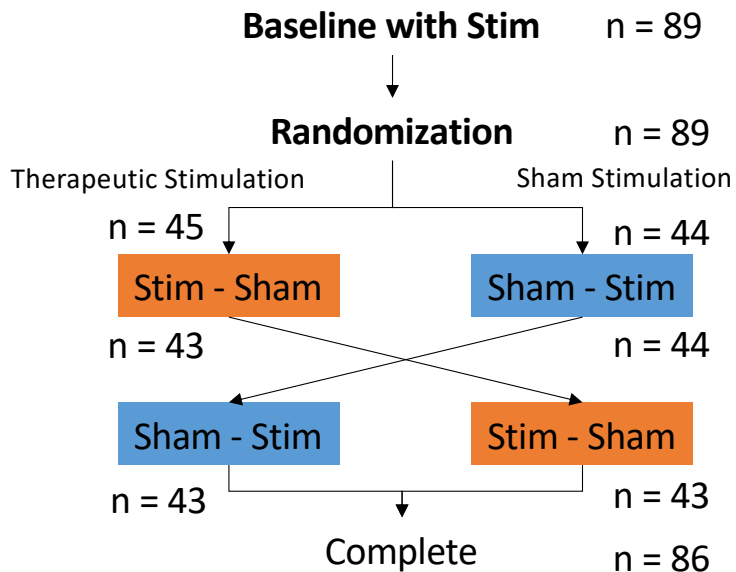

Nyxoah, Inspire Medical System, Löwenstein Medizintechnik, Neuwirth Medical Systems, XM Consult

- Fees for lectures and/or consulting activities
- Accommodation and travel expenses
- Research and study funds

	unilateral HNS Inspire® IV	bilateral HNS Nyxoah Genio System™	target HNS THN System, LivaNova
<i>Implantable device</i>	3 pieces (IPG, stimulation & sensor electrode)	1 piece (stimulation electrode)	2 pieces (IPG, stimulation lead)
<i>placement stimulation electrode</i>	distal (selective) medial branches of HN	distal (selective) medial branches of HN bilateral	main trunk of HN
<i>breathing cycle dependent</i>	yes (intercostal sensor, pressure sensor)	duty cycle dependent	no
<i>battery life expectancy</i>	~ 10.7 years	external battery & IPG (induction)	~10 to 15 years
<i>charging process</i>	not needed	every day, but external battery	induction – every 2. day for 10 to 15 minutes
<i>battery replacement</i>	IPG change	no change needed, due to external battery	IPG change
<i>programming</i>	by telemetry	external programming	by telemetry
<i>MRI</i>	Under certain requirements up to 1.5 Tesla (FDA: up to 1.5 Tesla)	whole body till 3.0 Tesla	none compatible
<i>therapy hypothesis</i>	active opening of the upper airway by selective breathing cycle dependent (inspiration) stimulation	active opening of the upper airway by selective duty cycle dependent stimulation	toning of the muscles by temporal variation of the stimulation field vectors which is breathing cycle independent

HNS and its evidence in the real world

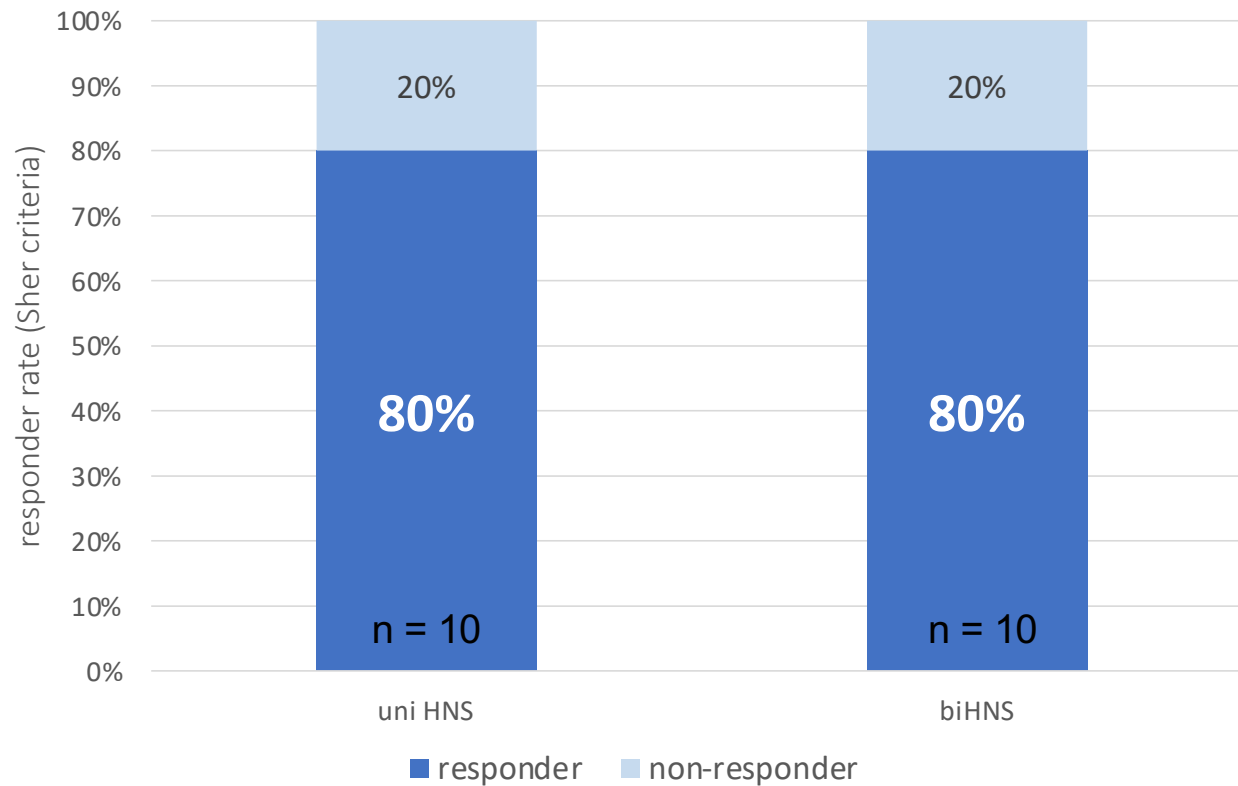

A Randomized Sham-Controlled Crossover Trial

Summary: Therapeutic HNS significantly improved AHI, ODI, ESS and FOSQ compared with sham stimulation.

Heiser C, Steffen A, Hofauer B, Mehra R, Strollo PJ Jr, Vanderveken OM, Maurer JT. Effect of Upper Airway Stimulation in Patients with Obstructive Sleep Apnea (EFFECT): A Randomized Controlled Crossover Trial. J Clin Med. 2021 Jun 29;10(13)

bilateral vs. unilateral HNS – month 6

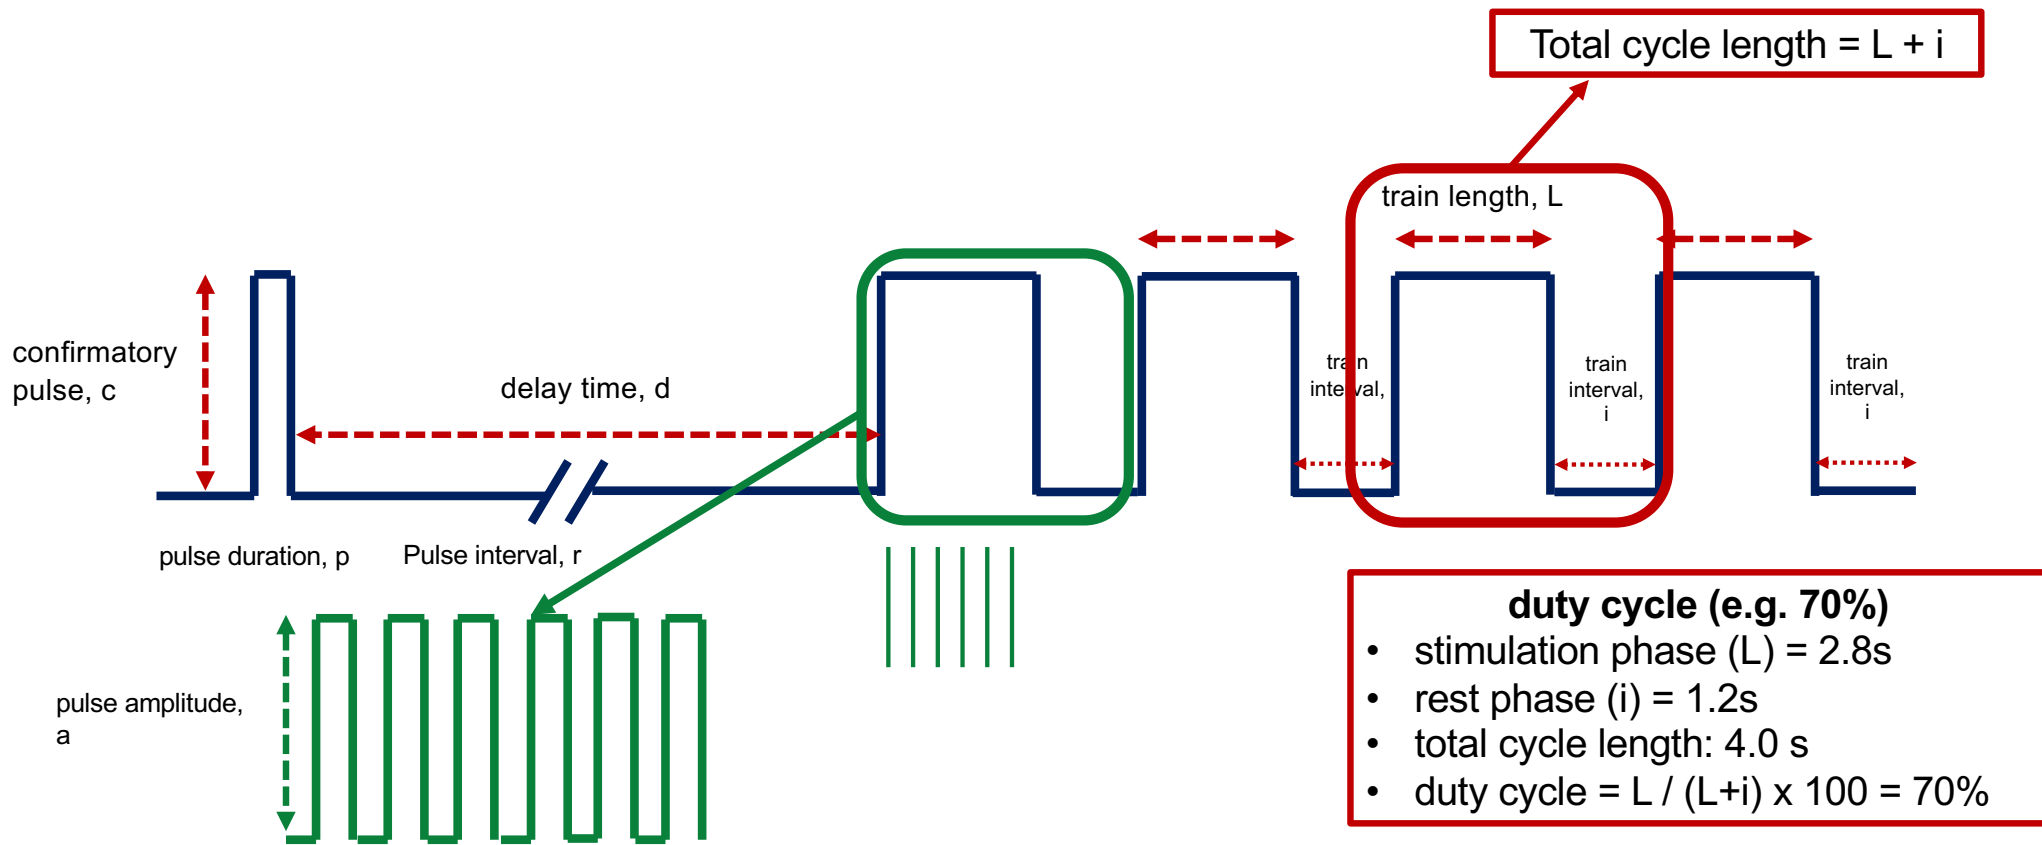

Partly published: Heiser C, Sommer JU, Hofauer B, de Vries N, Ravesloot MJ, Vanderveken OM, Jira D. Bilateral vs Unilateral Hypoglossal Nerve Stimulation in Patients With Obstructive Sleep Apnea. OTO Open. 2022 Jul 6;6(3):2473974X221109794.

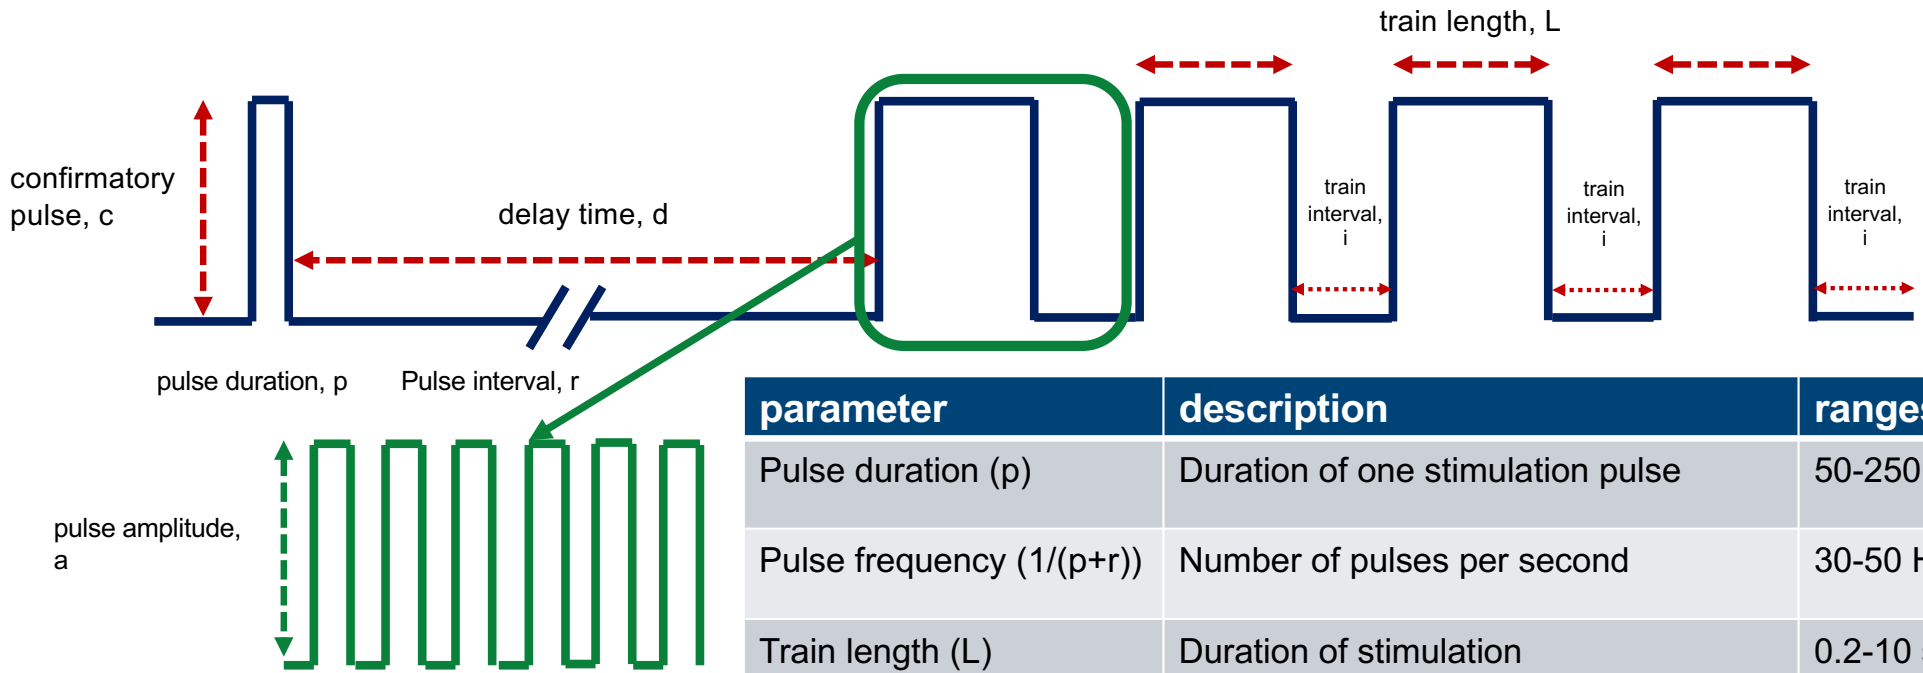

bilateral hypoglossal nerve stimulation

bilateral HNS – duty cycle stimulation

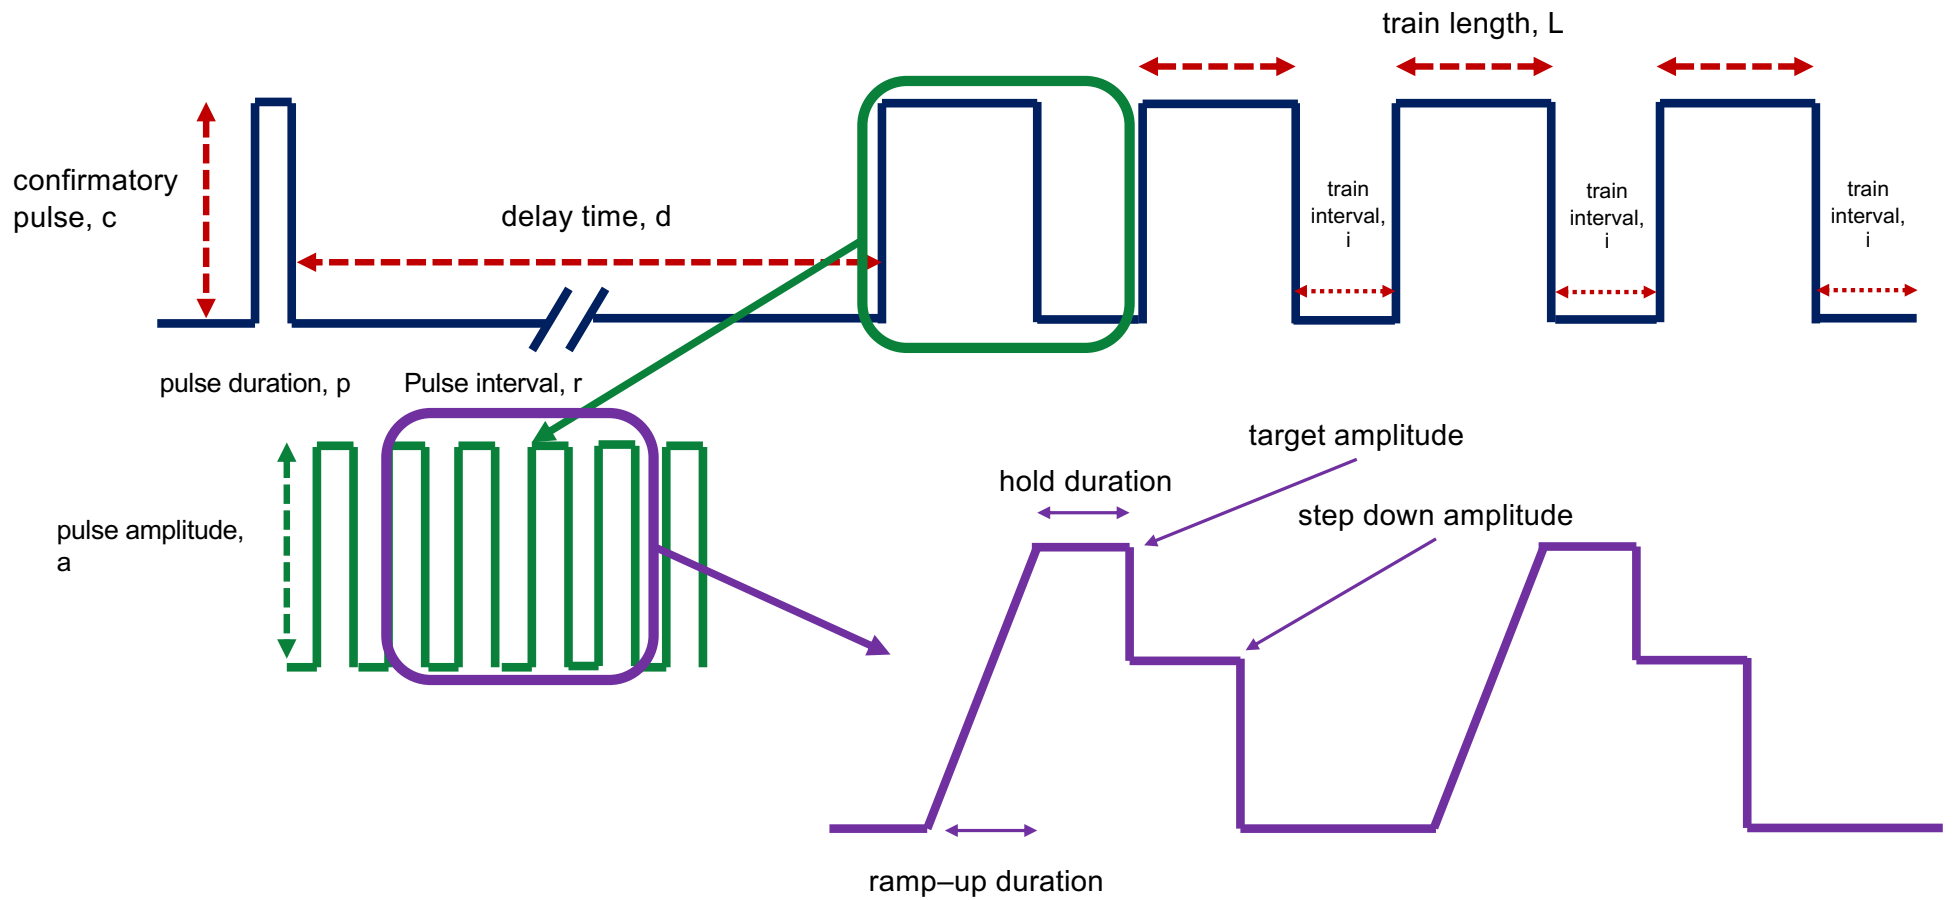

bilateral HNS – duty cycle stimulation

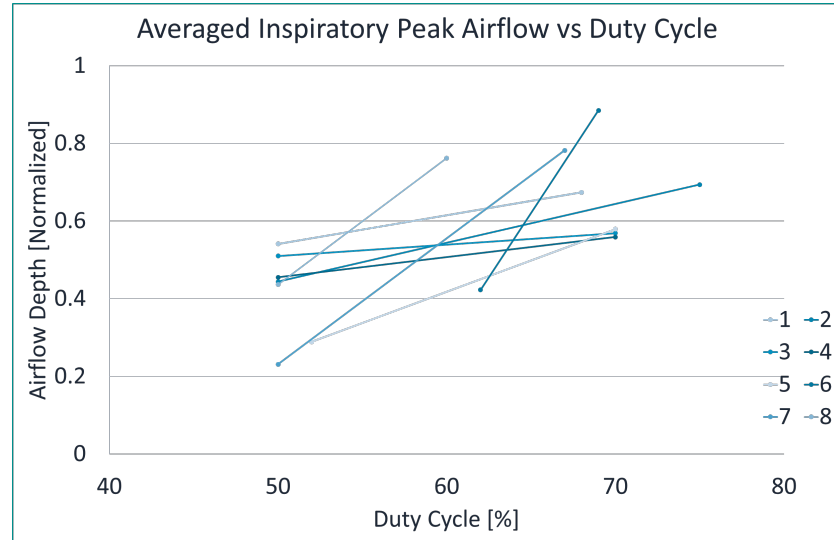

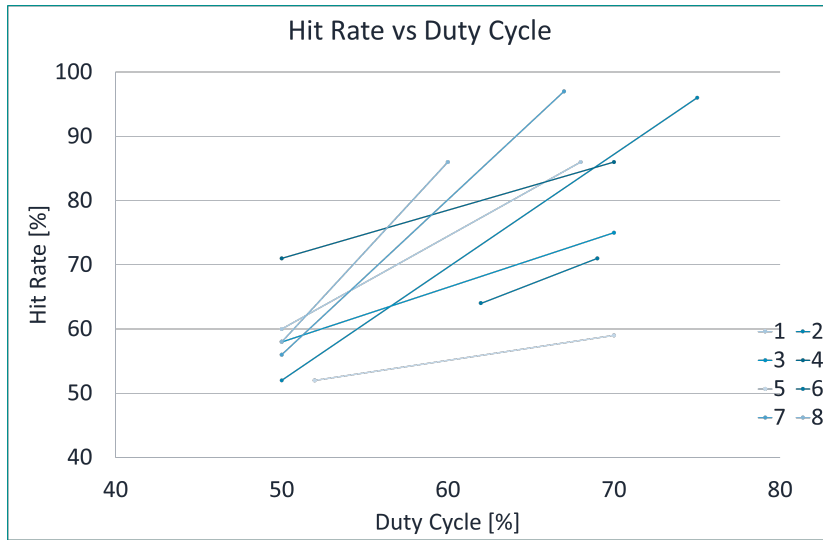

parameter	description	ranges
Pulse duration (p)	Duration of one stimulation pulse	50-250 μ s
Pulse frequency ($1/(p+r)$)	Number of pulses per second	30-50 Hz
Train length (L)	Duration of stimulation	0.2-10 s
Train interval (i)	Duration between 2 trains of stimulation	0.2 – 10 s
Pulse amplitude (a)	Stimulation amplitude	1-100 %
Delay time	Time to allow the patient to fall asleep	05-90 min

bilateral HNS – duty cycle stimulation

bilateral HNS – duty cycle stimulation

With increase in duty cycle

- the HIT rate increases in relation to inspiration
 - Increases inspiratory volume

Mechanism to open the upper airway

- > The pharynx: A flexible muscular tube suspended from the skull base and spine
 - > Modifiable in anterior-posterior **and caudal** directions
 - > **50 years of sleep surgery only modify A-P dimension**
- > Three physiologic supporting mechanisms
 1. **Genioglossus Tone**
 2. **Tracheal Traction**
 3. **Intrinsic Pharyngeal Muscle Tone**
- > **Opposing forces create synergistic effect**
 - > **Reduces need for intensive tongue protrusion**

Mechanism to open the upper airway

Unilateral HNS Only: Note partial R palatal movement anteriorly, persistent LW collapse

Unilateral HNS + Sternothyroid: Note improved palatal opening; LW stabilization

Kent DT, Scott WC, Zeale D, Schwartz AR. Ansa cervicalis stimulation increases pharyngeal patency in patients with obstructive sleep apnea. *J Appl Physiol* (1985). 2021 Aug 1;131(2):487-495

ANSA cervicalis stimulation

Summary / Conclusion

HNS (uni- & bilateral) in the clinical routine is

- safe
- well tolerated & accepted by the patients
- shows good adherence
- And highly effective

New innovative therapeutic approaches in this field will make neurostimulation to smart neuromodulation.

The AcuPebble Opportunity

What is AcuPebble?

And why AcuPebble might be a perfect match for LunaLab...

“A sensor records sounds generated by respiratory and cardiac functions and blood oxygen.”

How it works...

- Data transfer to a patient owned mobile device

- Upload to the cloud

- Signal processing algorithms using hyperscalable cloud computing

TEST RESULT

**THE PATIENT HAS
MODERATE SLEEP
APNOEA**

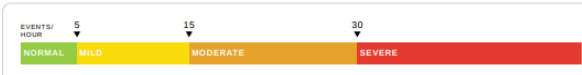

This diagnosis follows the AASM criteria version 2.5

CLINICIAN COMMENTS
No comments entered

DIAGNOSIS

DIAGNOSTIC INDEX	SEVERITY	EVENTS/HOUR
3% desaturation		
AHI3	MODERATE	21
ODI3	MODERATE	17
4% desaturation		
AHI4	MODERATE	21
ODI4	MODERATE	17

EVENTS/HOUR: 5 (NORMAL), 15 (MILD), 30 (SEVERE)

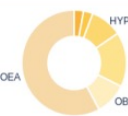

DEFINITIONS

- **AHI3** Average number of events per hour with events defined as per AASM version 2.5
- **ODI3** Average number of 3% oxygen desaturation events per hour.
- **AHI4** Average number of events per hour with events defined as per AASM version 2.5 but with desaturation threshold at 4%.
- **ODI4** Average number of 4% oxygen desaturation events per hour.

EVENTS ANALYSIS

AHI3 APNOEA EVENTS ANALYSIS

TYPE OF EVENT*	PERCENTAGE	AVG./HOUR
● CENTRAL APNOEA	2.9%	0.6
● CENTRAL OR OBSTRUCTIVE APNOEA ¹	2.9%	0.6
● HYPOPNOEA	9.8%	2
● OBSTRUCTIVE APNOEA (100%) ²	16.7%	3.5
● OBSTRUCTIVE APNOEA (≥90%) ³	9.8%	2
● OBSTRUCTIVE APNOEA OR HYPOPNOEA ⁴	57.9%	12.1

AHI4 APNOEA EVENTS ANALYSIS

TYPE OF EVENT*	PERCENTAGE	AVG./HOUR
● CENTRAL APNOEA	2.9%	0.6
● CENTRAL OR OBSTRUCTIVE APNOEA ¹	2.9%	0.6
● HYPOPNOEA	9.8%	2
● OBSTRUCTIVE APNOEA (100%) ²	16.7%	3.5
● OBSTRUCTIVE APNOEA (≥90%) ³	9.8%	2
● OBSTRUCTIVE APNOEA OR HYPOPNOEA ⁴	57.9%	12.1

0 - Type of event considered in diagnosis and AHI
 1 - Events with flow reduction larger than 90%, but unclear whether caused centrally or by obstruction
 2 - 100% cessation of breathing
 3 - Flow reduction ≥90% of pre-event baseline but not total cessation of breathing
 4 - Events with estimated desaturation >4% and flow reduction >70%, but unclear whether larger or smaller than 90%
