

# Lost in Translation? Predict first-in-human PK with Simcyp Discovery

18<sup>th</sup> October 2022

Hannah M. Jones, Certara

# Session Description and Objectives

This session will focus on:

- Basic PBPK concepts – model background, model inputs and modelling strategy
- Paradigms for applying PBPK modelling to support FIH dose selection
- Other potential applications for PBPK in the discovery and pre-clinical phases of drug development

# Biography: Hannah M. Jones, Ph.D.

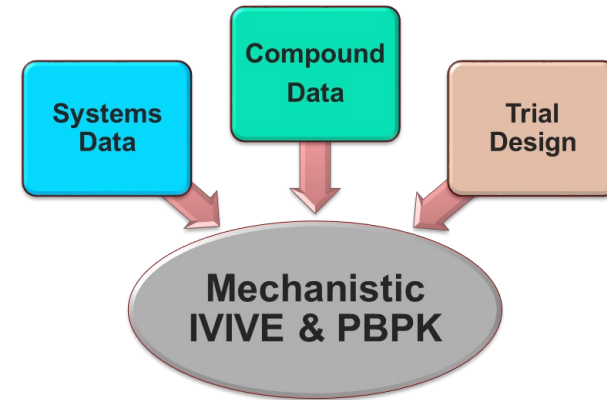

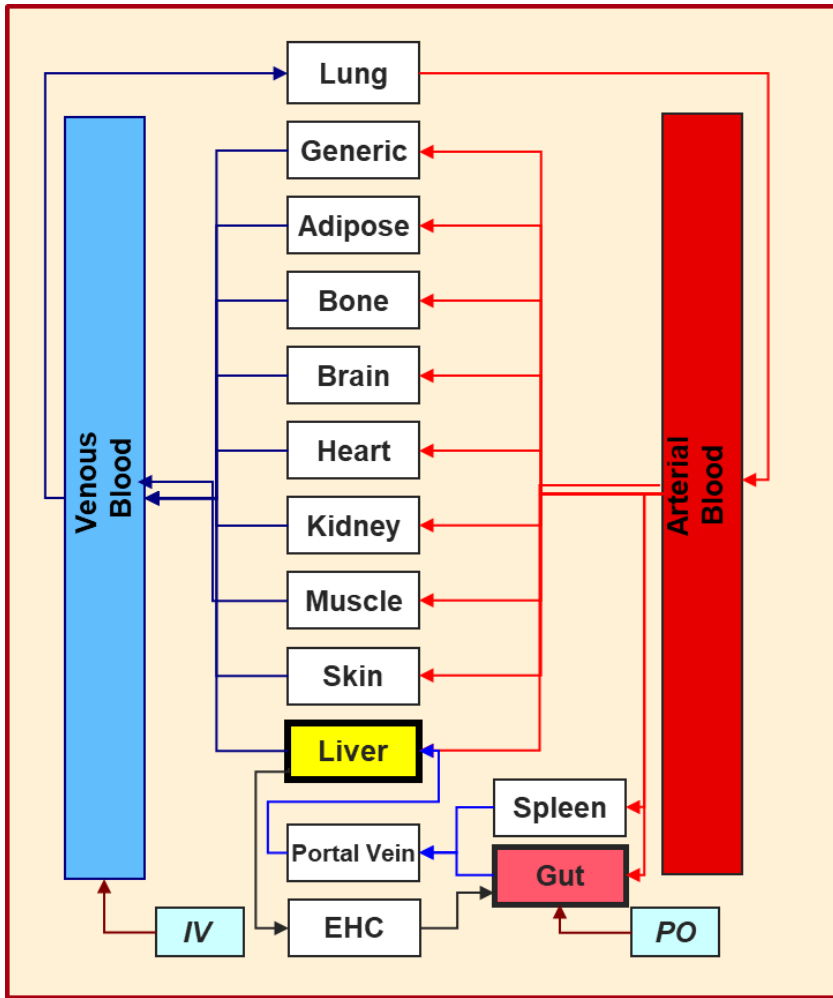

- Scientific leader in modelling and simulation
- Head of PBPK Consulting Services at Certara
- 20+ years in global pharmaceutical organizations (including Pfizer & Roche)
- Over 60 publications in PBPK/PKPD modelling and other DMPK related topics
- Considerable experience influencing drug research and development programs through modelling and simulation

[hannah.jones@certara.com](mailto:hannah.jones@certara.com)

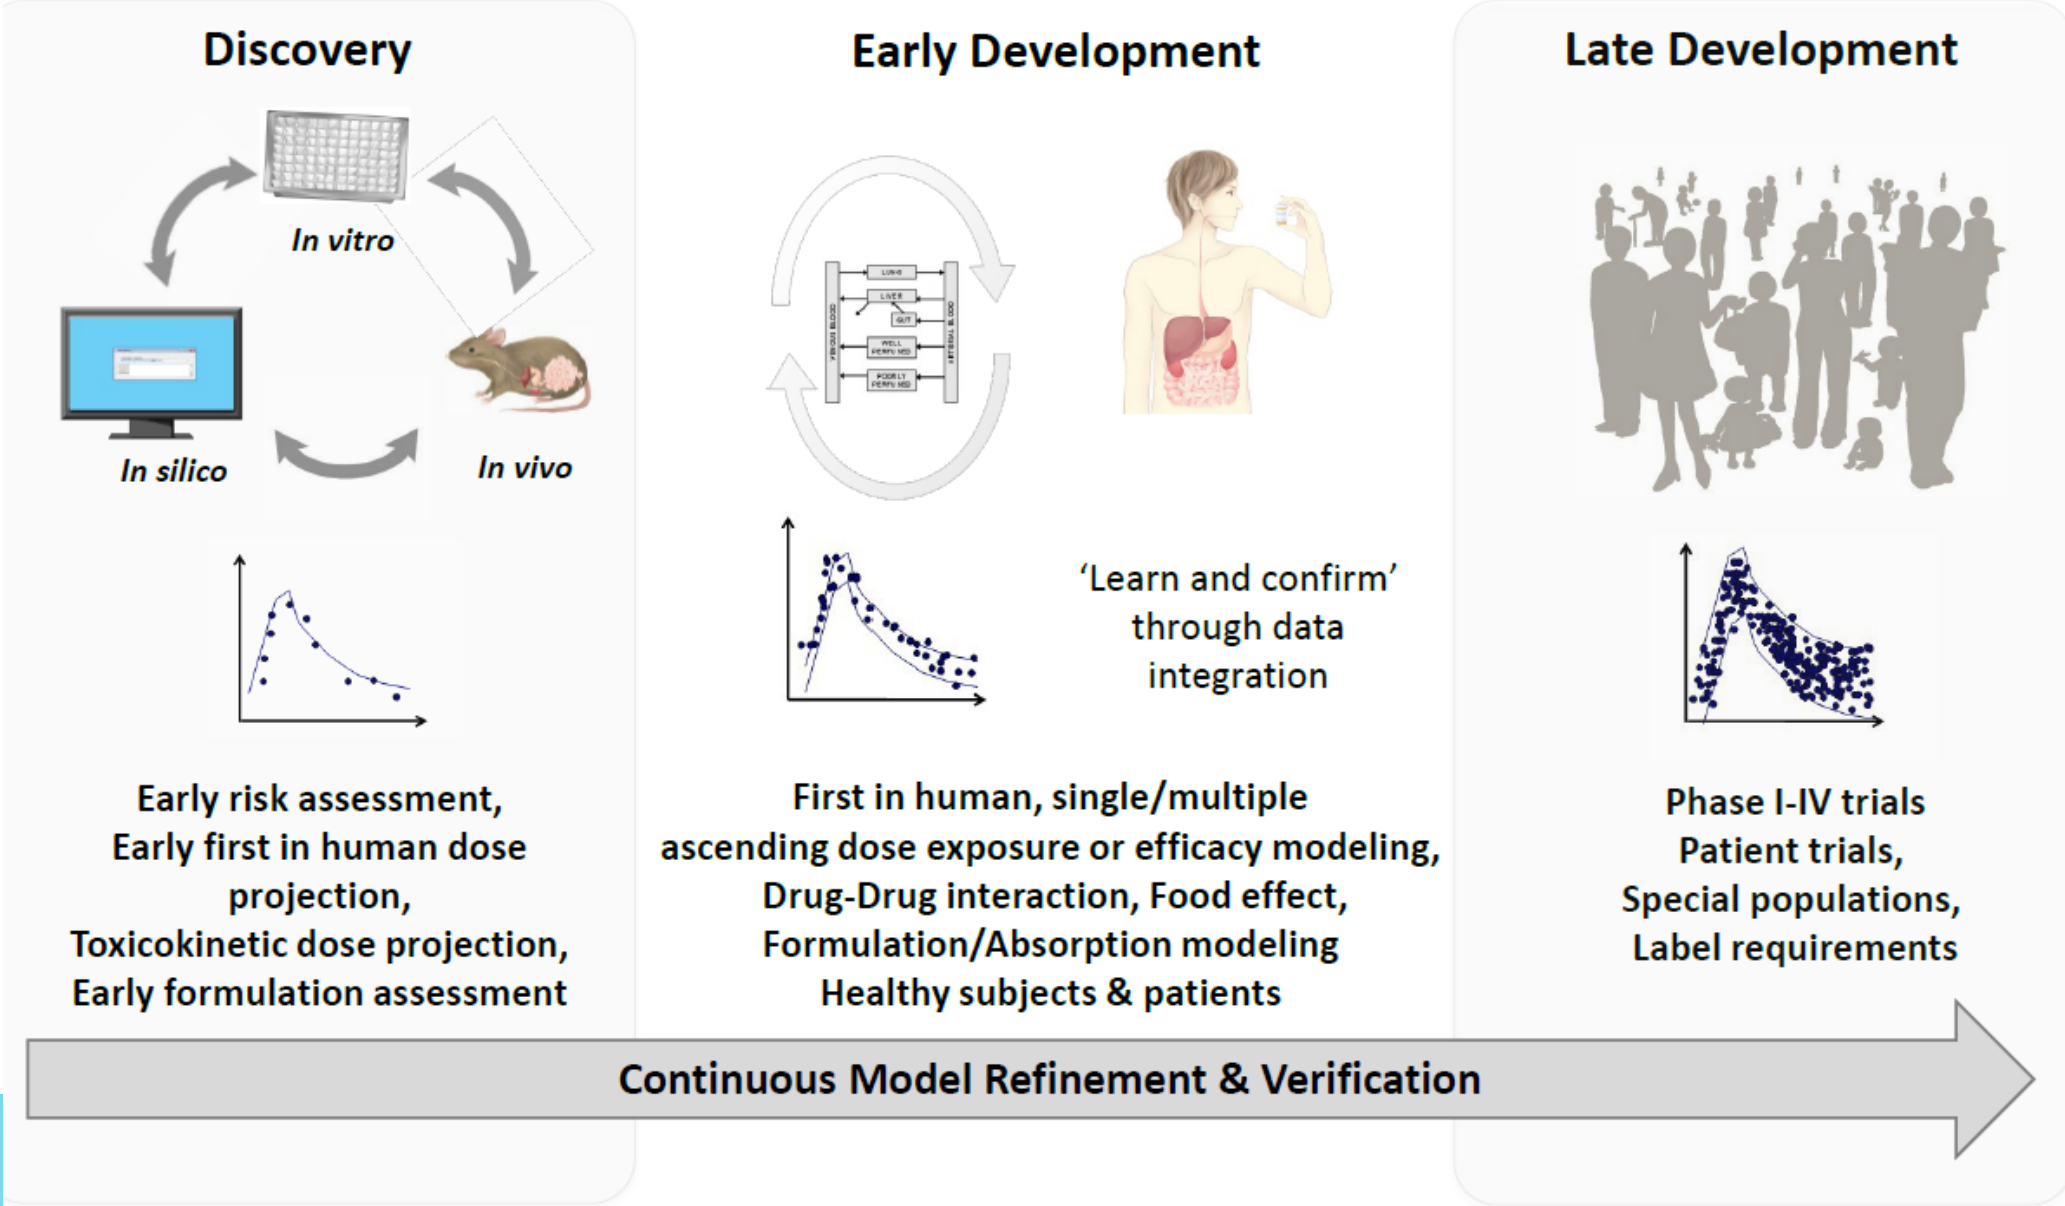

*Sr. Vice President and  
Head of PBPK Consulting  
Services at Certara*

# What is Whole body PBPK modelling?

# PBPK application in drug discovery and development

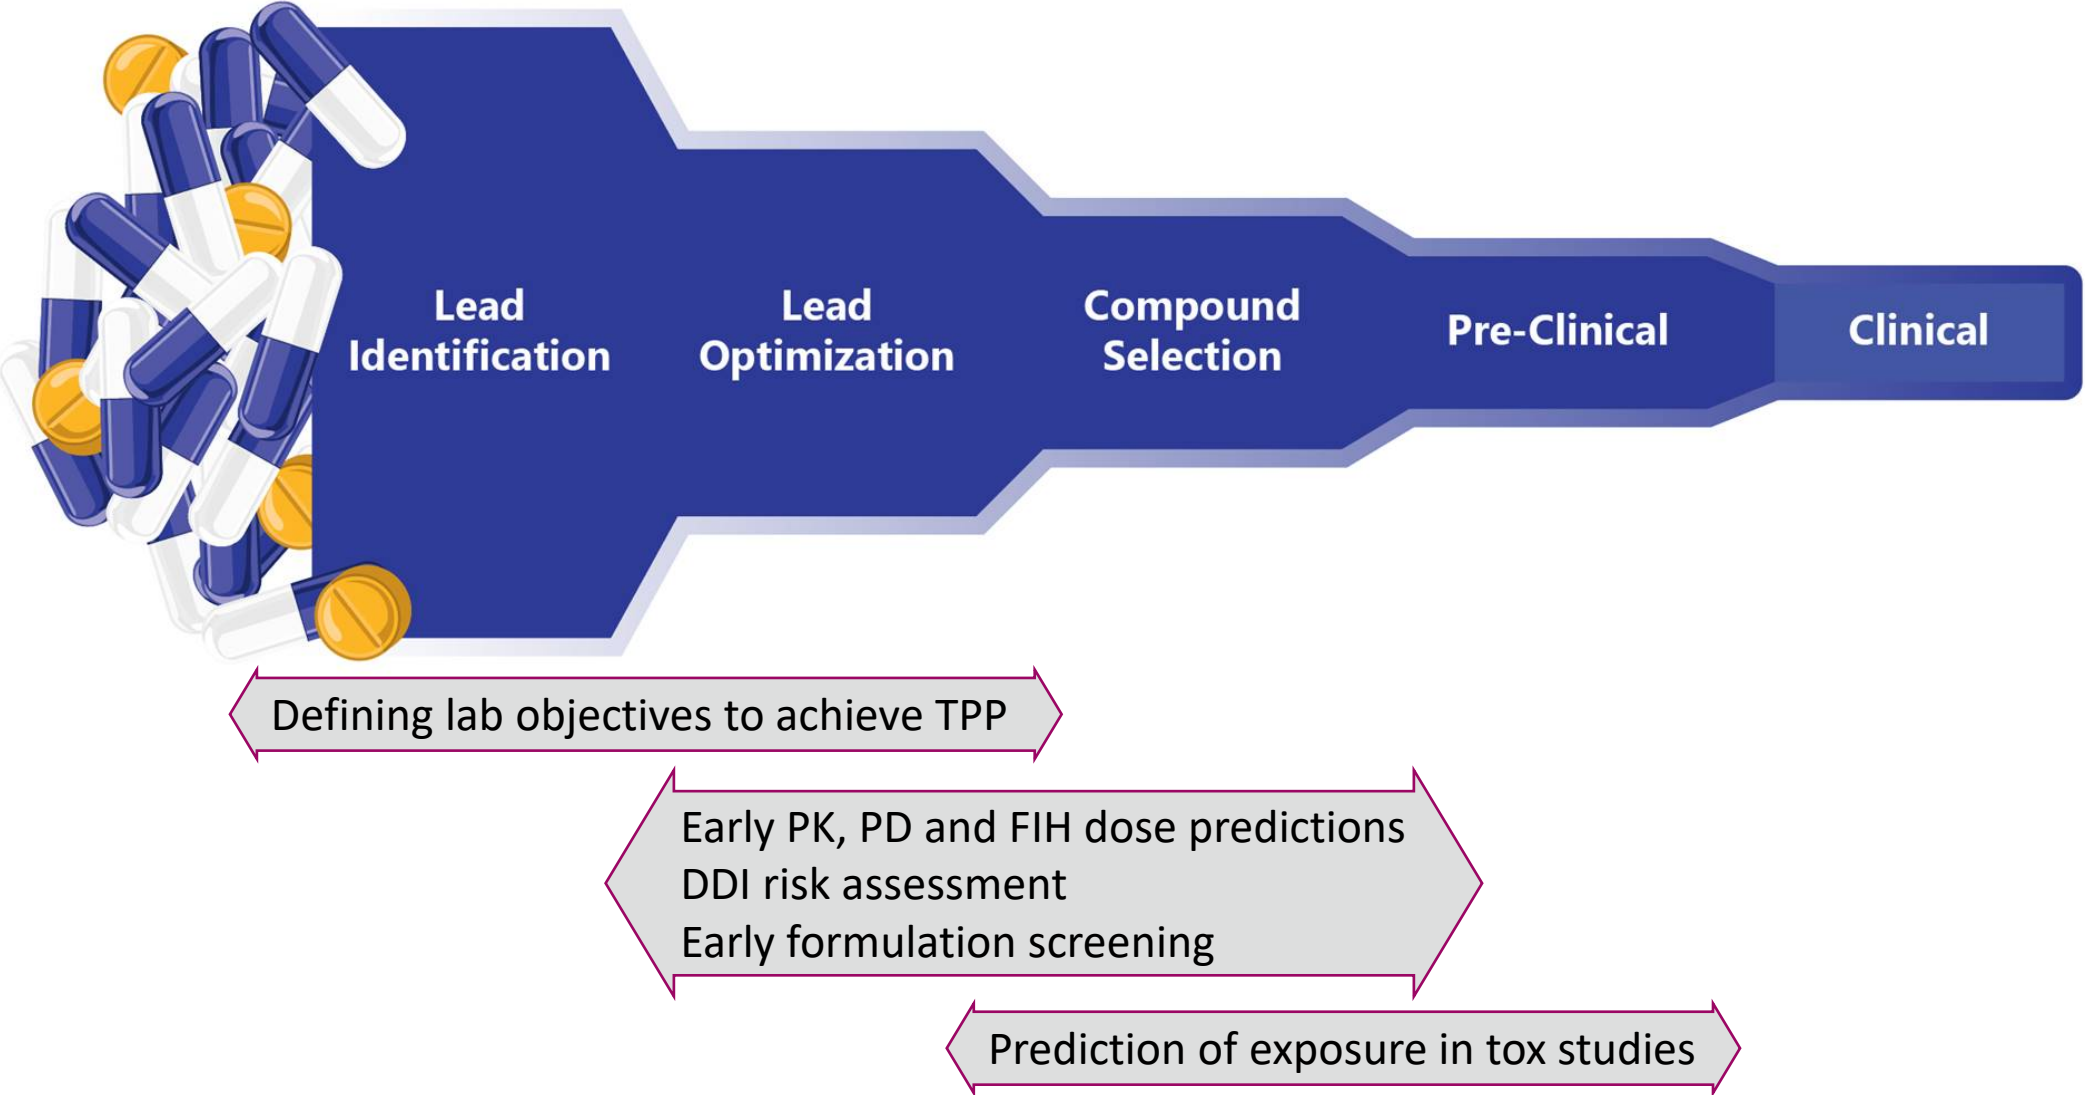

# Simulating Virtual Patients and Waiving Clinical Studies

More than 300 label claims for 90+ novel drugs using the Simcyp Simulator

# PBPK Applications and Benefits in Discovery

TPP = target product profile; PK = pharmacokinetics; PD = pharmacodynamics; FIH = first-in-human; DDI = drug-drug interactions

# PBPK Modeling Strategy for FIH simulations

# Typical PBPK Model Input Parameters

- Physchem information e.g. MW, LogP, pKa
- Plasma protein binding (fu), Blood:Plasma ratio (BP)
- In vitro CLint data / In vivo CL
- Passive permeability e.g. MDCK, Caco-2
- Aqueous solubility, biorelevant solubility e.g. FaSSIF/FeSSIF/FaSSGF
- Target exposure /dosing regimen / formulation required in human
- In vivo PK data for verification
  
- Inhibition Parameters for static DDI calculations (if applicable)

# New PBPK tool – Simcyp Discovery

New PBPK simulator from Simcyp for discovery and translational scientists

- *Derived from the gold-standard Simcyp Simulator*
- *Species -> mouse, rat, dog, monkey and human*
- *Population info -> demographics, liver / GI tract, tissue flows, volumes and composition*
- *Compound info -> physchem, protein binding, solubility, permeability, clearance, transporters, PD*
- *Allows PK prediction across species*
- *Static DDI calculator for early DDI risk assessment*

**CERTARA**

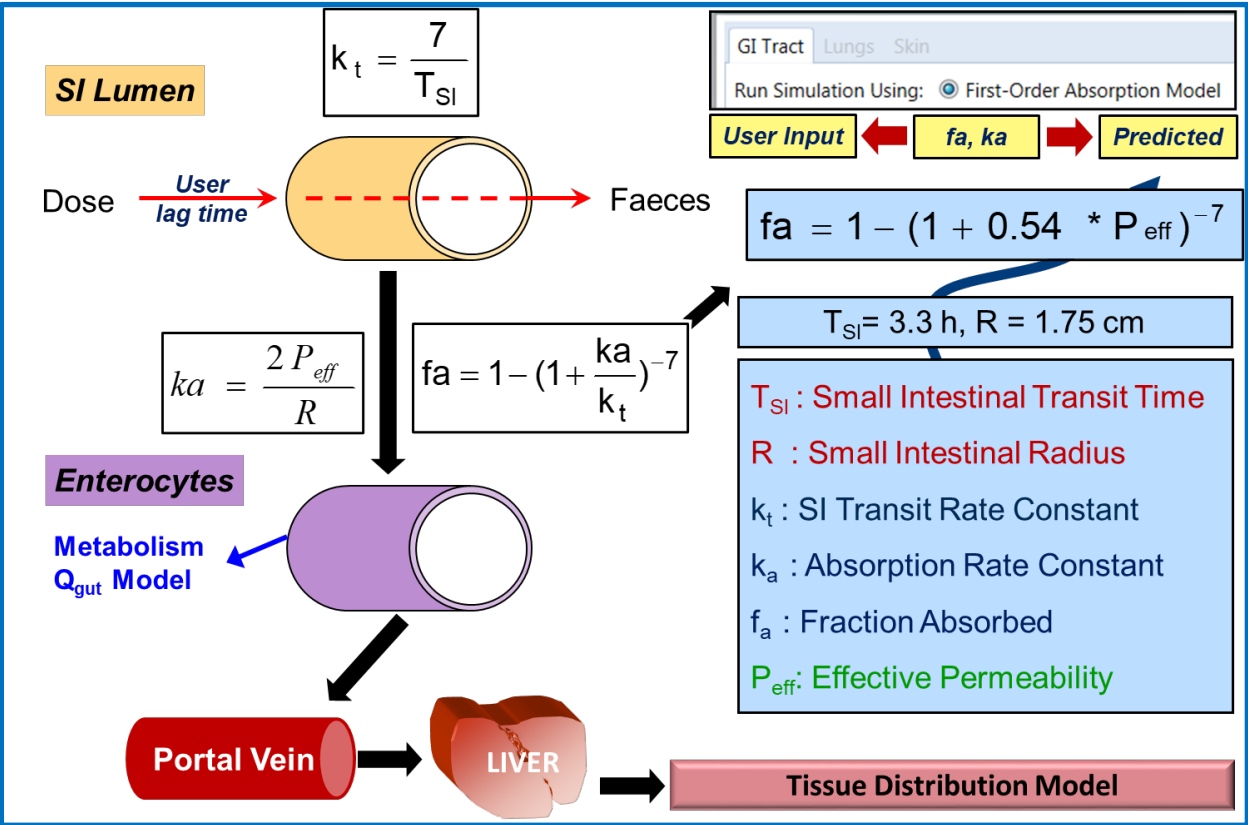

Simcyp™ Discovery

# First Order and ADAM Models Available

## First order absorption model

For straightforward /"middle-out" modelling

## ADAM (advanced dissolution absorption and metabolism) model

For more complex /"bottom up" modelling

# Prediction of Absorption using the ADAM model

## ADAM (Advanced Dissolution Absorption and Metabolism) Model

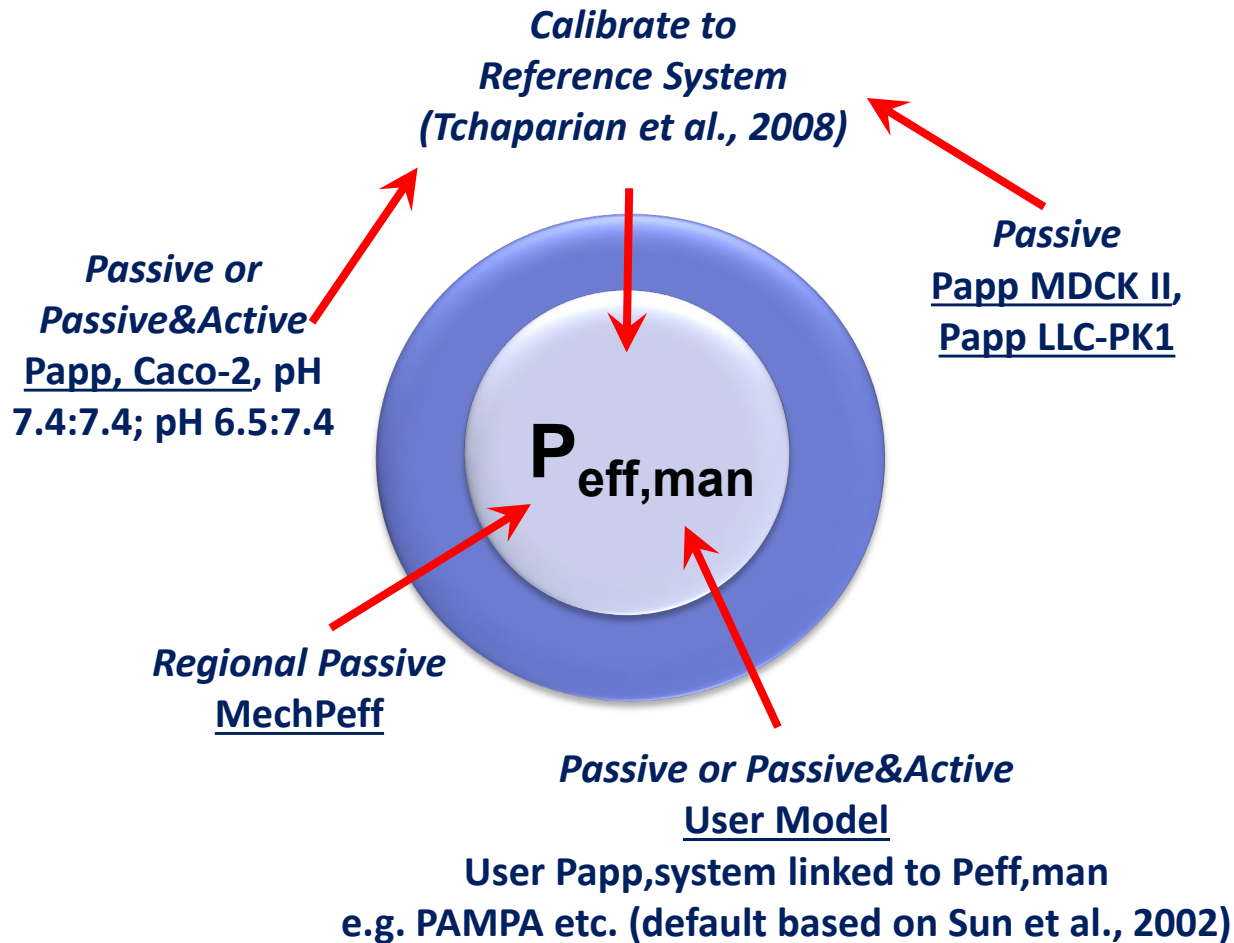

*Key input parameters include solubility, permeability and particle size*

*Model predicts how the drug goes in and out of solution as it goes through the GIT and once in solution gets absorbed as a function of the permeability*

*Transporter effects can also be incorporated*

# Prediction of Permeability and Intestinal Metabolism

## Permeability (P<sub>eff</sub>) prediction

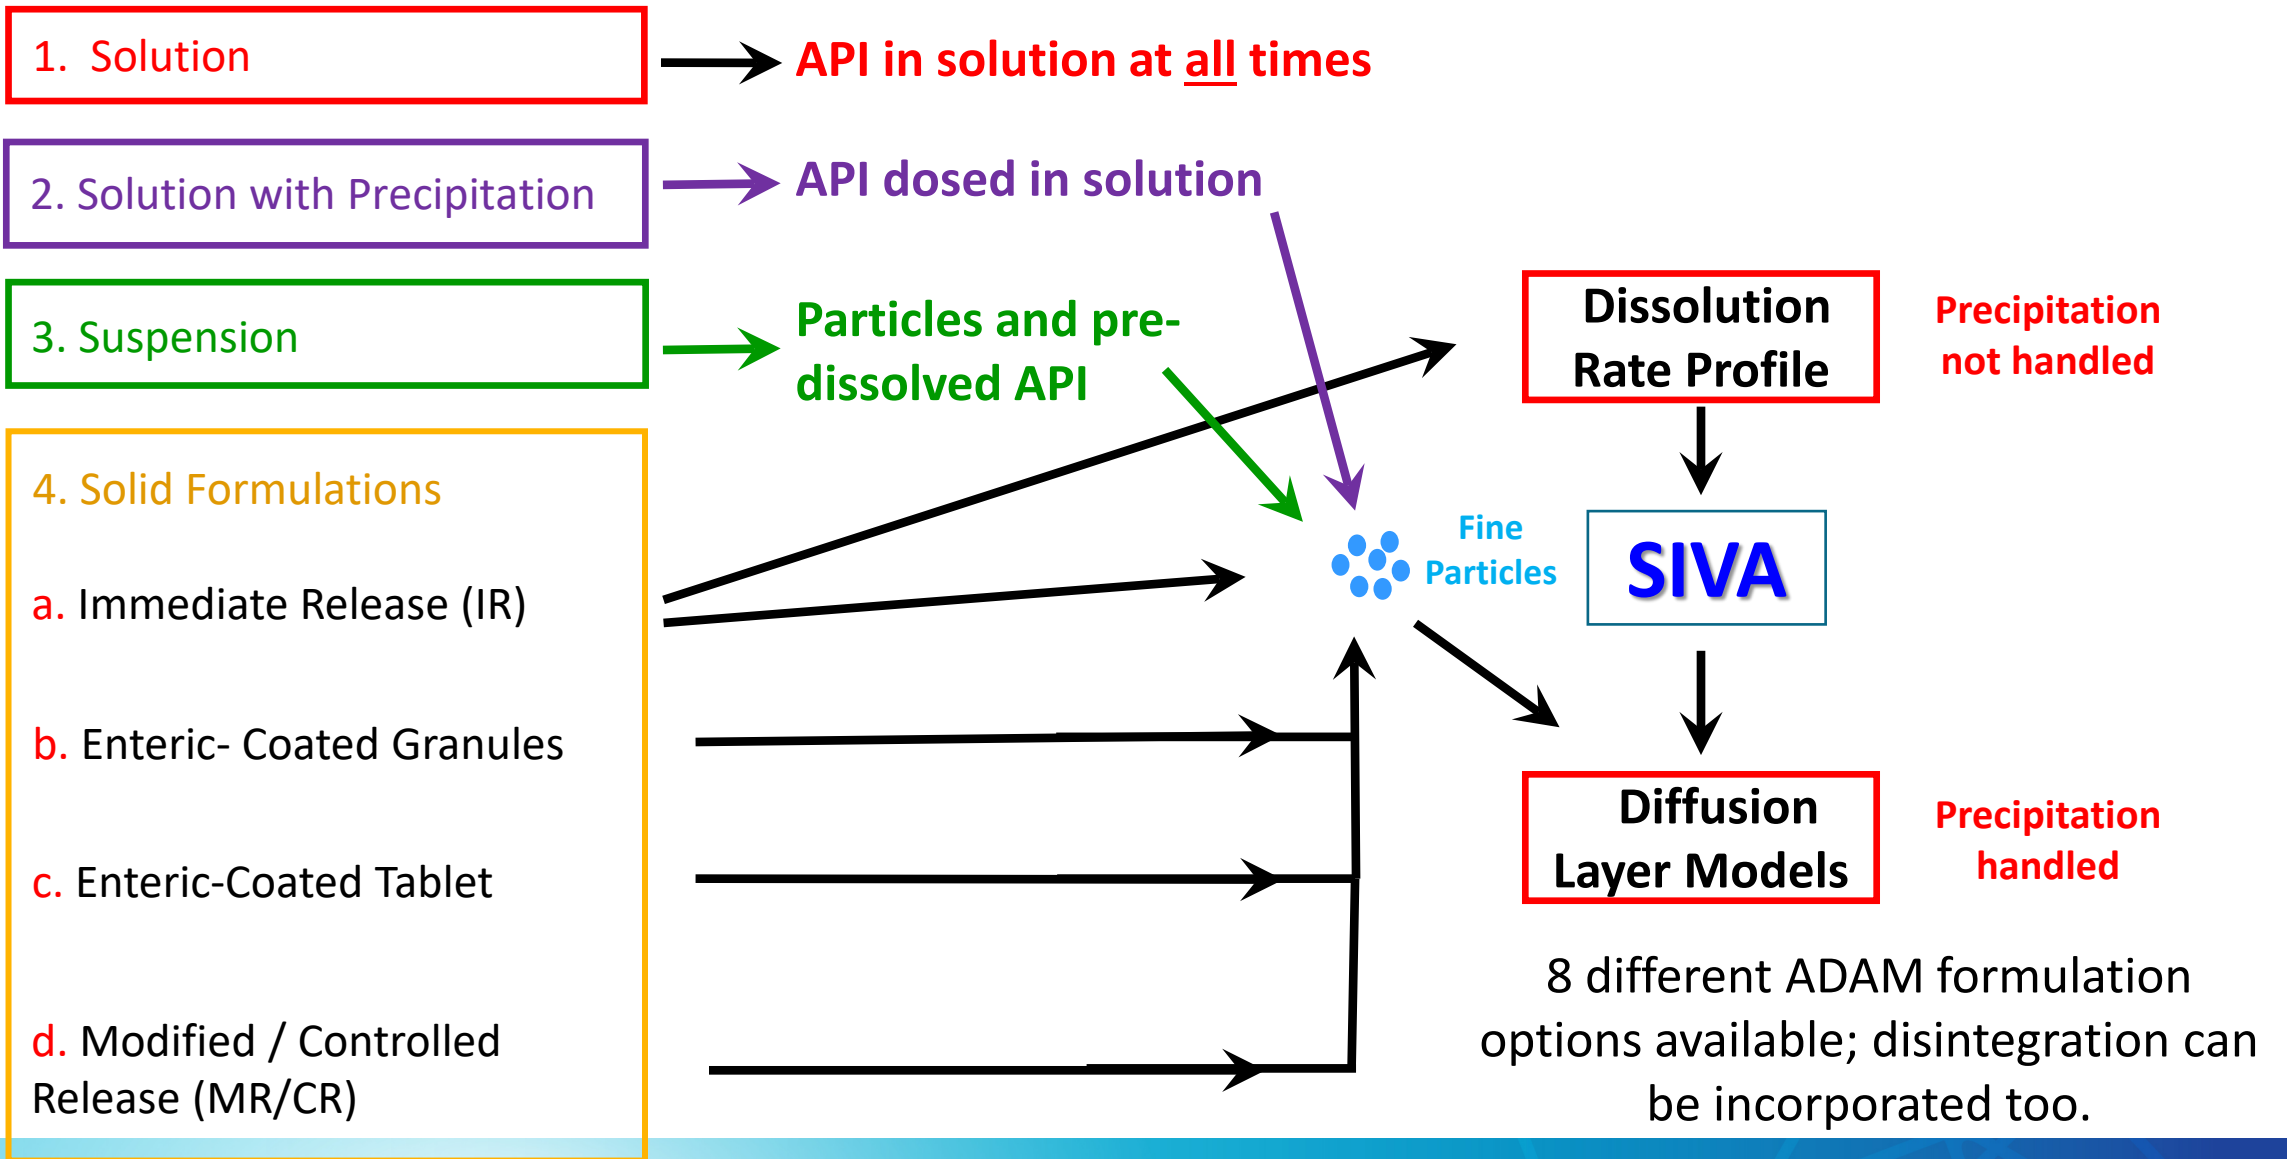

## Intestinal CL<sub>int</sub> prediction

IM	$\frac{\mu\text{L} \cdot \text{min}^{-1}}{\text{mg protein}}$	X	IMPPI	Direct Scaling approaches
IS	$\frac{\mu\text{L} \cdot \text{min}^{-1}}{\text{g intestine}}$	X	IW	
LM	$\frac{\mu\text{L} \cdot \text{min}^{-1}}{\text{mg protein}} \times \frac{\text{Enz abundance}_{\text{int}}}{\text{Enz abundance}_{\text{iv}}}$	X	MPPI	Absolute Enzyme abundance Scaling approaches
rCYP	$\frac{\mu\text{L} \cdot \text{min}^{-1}}{\text{pmol enzyme}} \times \frac{\text{pmol enzyme}}{\text{mg mic protein}}$	X		

# Different ADAM Formulation Options

# Drug Distribution Models – Minimal PBPK

● Minimal PBPK Model

○ Full PBPK

○ Compartmental

$$V_{ss} = V_p + V_e \times E:P + \sum_t V_t \times P_{t:p}$$

$V_p$  = volume of plasma;  $V_e$  = volume of erythrocyte;  $V_t$  = tissue (t) volume

E:P = Erythrocyte : Plasma partition coefficient

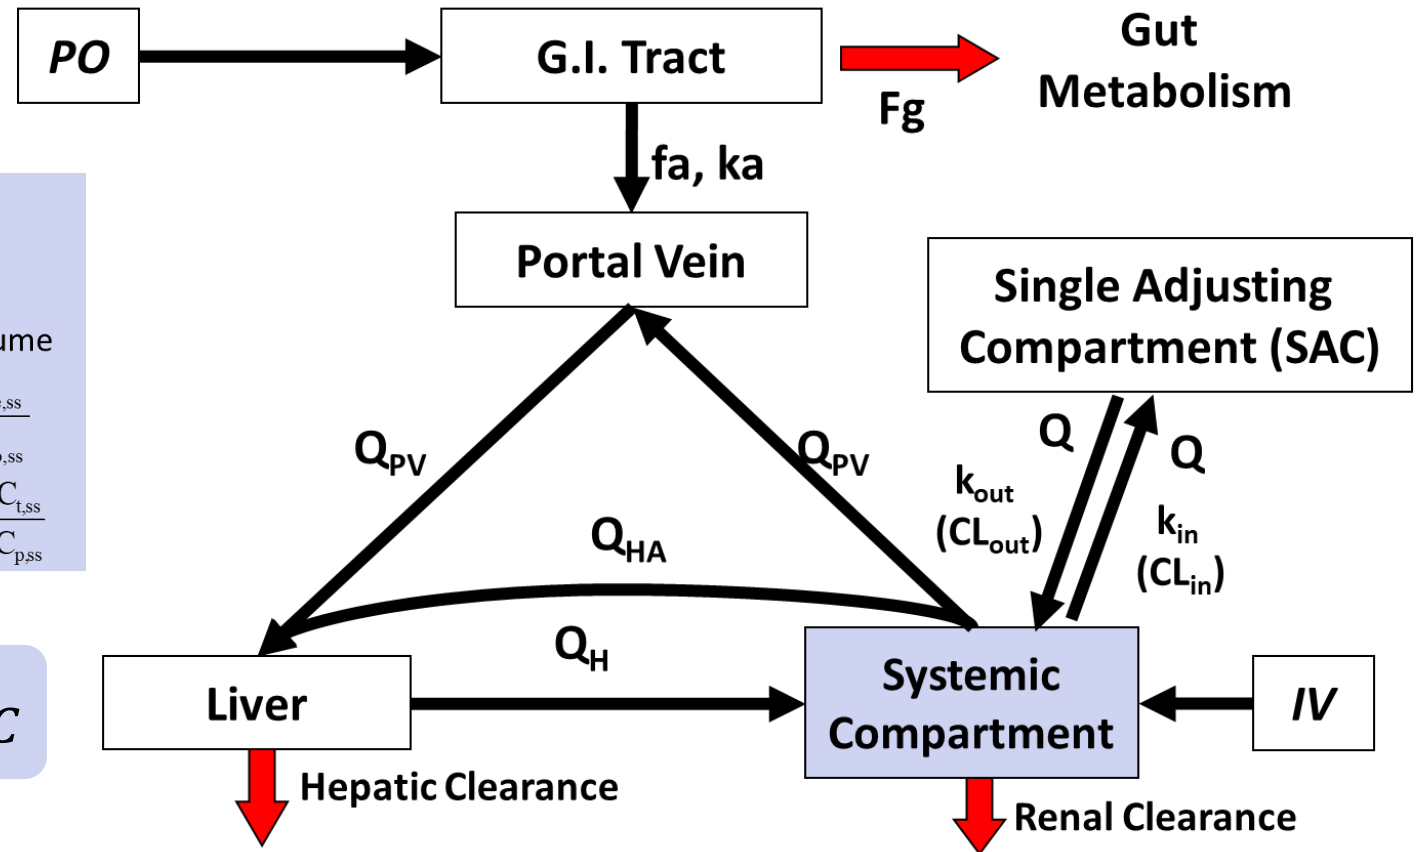

$P_{t:p}$  (or  $K_p$ ) = Tissue Plasma partition coefficient

$$E:P = \frac{C_{e,ss}}{C_{p,ss}}$$

$$P_{t:p} = K_p = \frac{C_{t,ss}}{C_{p,ss}}$$

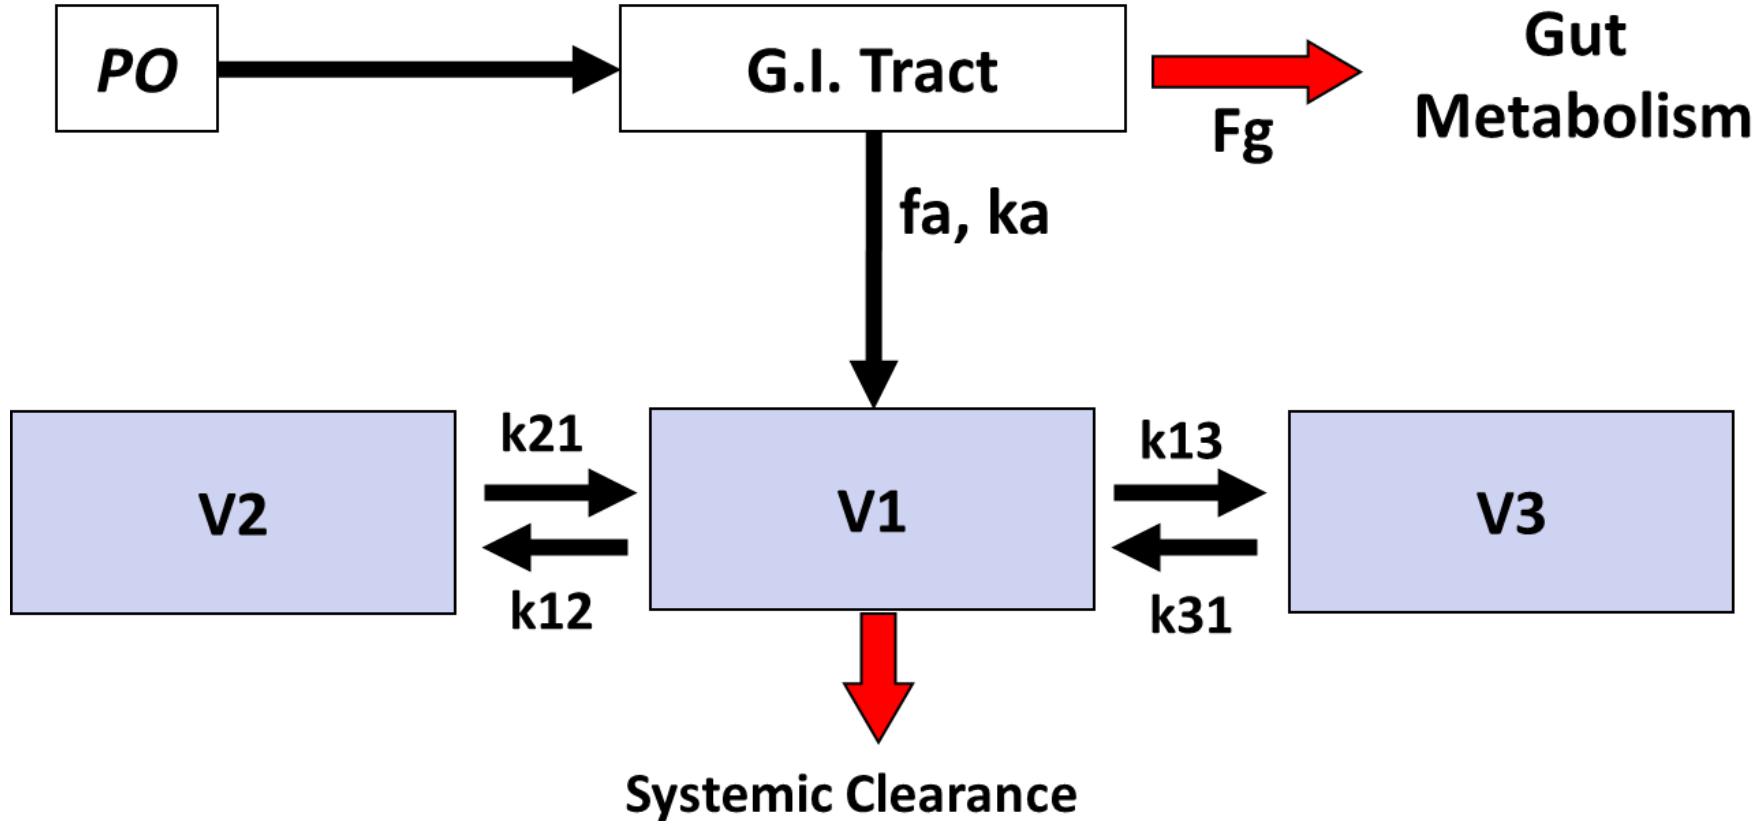

$$V_{sys} = V_{ss} - V_L \cdot K_{p:liver} - V_{SAC}$$

*“middle out” approach*

# Drug Distribution Models – Compartmental Models

- Minimal PBPK Model
- Full PBPK
- Compartmental

*Maybe used when IV PK known and when model is being used to predict/verify absorption only*

# Drug Distribution Models – Full PBPK

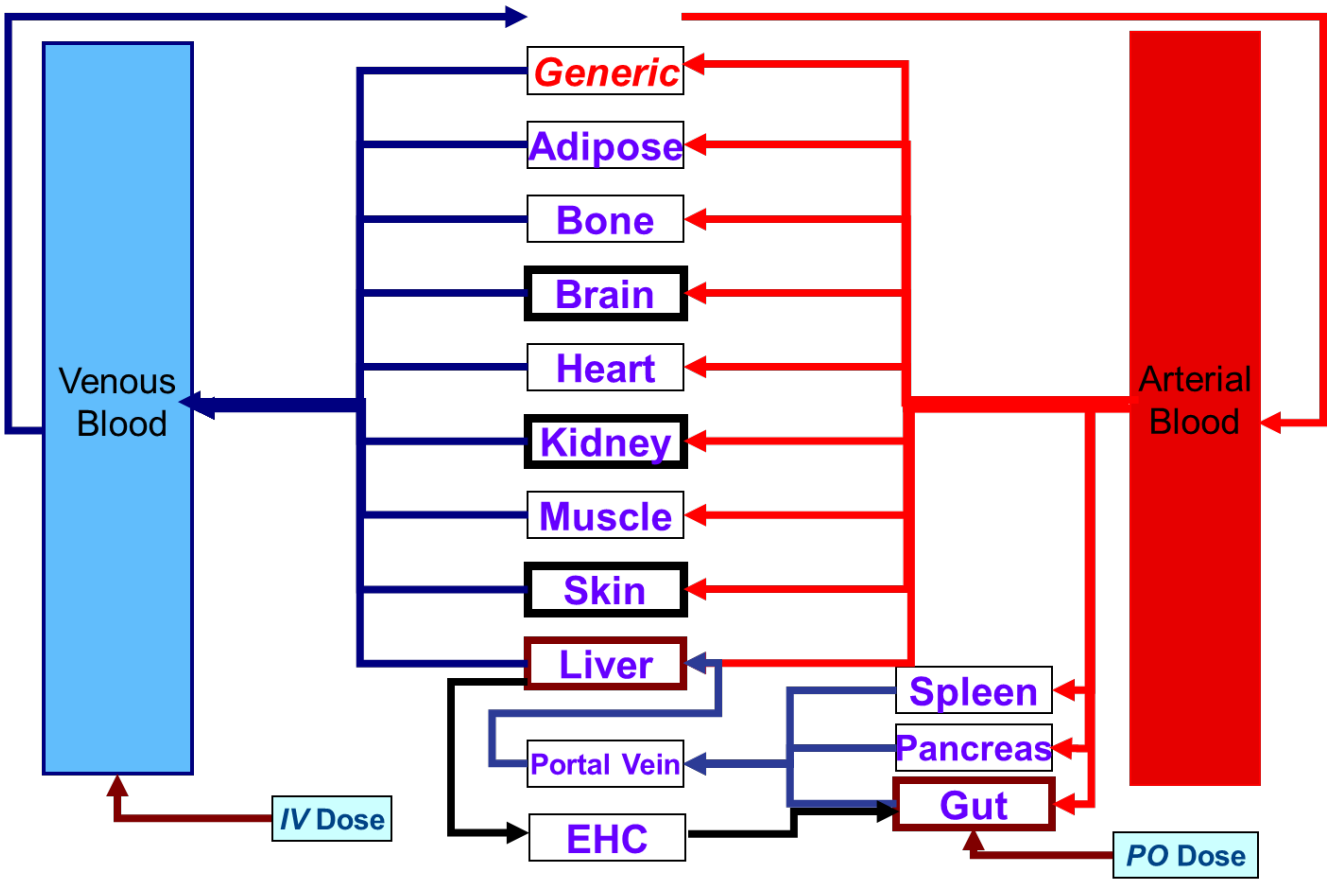

- Minimal PBPK Model
- Full PBPK
- Compartmental

$$V_{ss} = V_p + V_e \times (E:P) + \sum_t V_t \times P_{t:p}$$

$V_p$  = volume of plasma;  $V_e$  = volume of erythrocyte;  $V_t$  = tissue (t) volume

E:P = Erythrocyte : Plasma partition coefficient  $E:P = \frac{C_{e,ss}}{C_{p,ss}}$

$P_{t:p}$  (or  $K_p$ ) = Tissue Plasma partition coefficient  $P_{t:p} = K_p = \frac{C_{t,ss}}{C_{p,ss}}$

*“bottom up” approach most frequently used in FIH predictions*

# Prediction of Distribution using Kp prediction methods (1-3)

**Method 1 Poulin and Theil (Berezhkovskiy, 2004)**

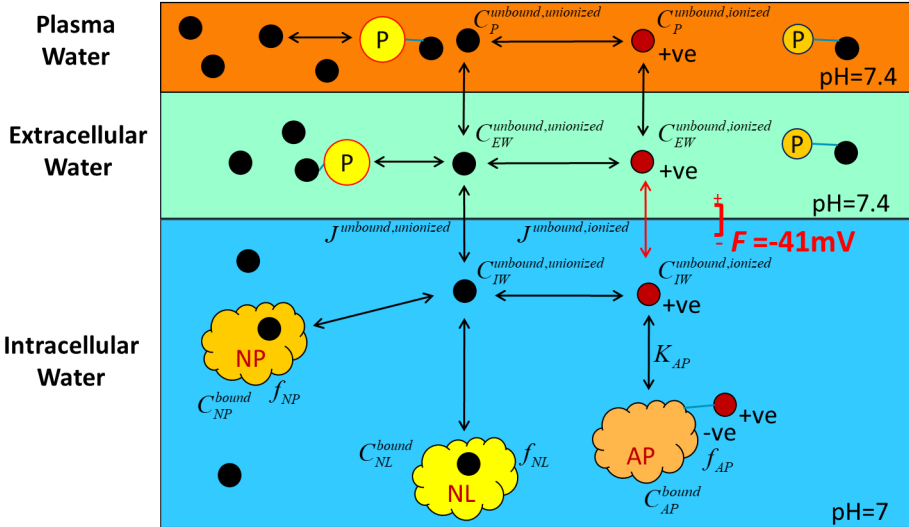

NL: Neutral Lipids  
NP: Neutral Phospholipids P: Proteins

**Method 2 Rodgers & Rowland (R&R)**

NL: Neutral Lipids AP: Acidic Phospholipids  
NP: Neutral Phospholipids P: Proteins

**Method 3 R&R with ion permeability**

NL: Neutral Lipids AP: Acidic Phospholipids  
NP: Neutral Phospholipids P: Proteins

**Increasing complexity**

Note - may also compare these methodologies to allometry generally predicts Vss well to provide more confidence

# Prediction of Clearance using in vitro and in vivo data

## Prediction of CL from in vitro data

Prediction of excretion processes should also be considered (biliary and renal)

Allometric scaling from multiple or single species

# Flexibility for Variable Input & Added Complexity

Compound Parameters	Library Parameters	
	LIVER	GI TRACT
1. Whole Organ Clearance	MPPGL	MPPI
	HPGL	
	Liver weight	
	$Q_H$	$Q_{villi}$
2. Enzyme Kinetics ( $V_{max}$ , $K_m$ , $CL_{int}$ )	ISEF (CYP)	Absolute abundance <sub>e</sub>
		Absolute abundance <sub>e</sub>
- “e” refers to the individual drug metabolising enzyme	MPPGL	MPPI
	Liver weight	
	$Q_H$	$Q_{villi}$
3. Additional Clearance	MPPGL	MPPI
	HPGL	Intestinal slices
	Liver weight	
	$Q_H$	$Q_{villi}$

***CL estimates from allometry/single species scaling can also be used***

# Prediction of Excretion in Simcyp Discovery

Quantitatively the two most important mechanisms of drug excretion are:

## Renal Clearance

Passive and active processes can be important

Can be predicted allometrically and included in the PBPK model in Simcyp Discovery

## Biliary Clearance

If this is quantitatively important for drug elimination it is invariably an active (transporter driven) process

It is possible to account for biliary excretion as an overall process and by a specific transporter in Simcyp Discovery

# PBPK Strategies from the Literature – Pre-Clinical Studies

Early IVIVE-PBPK studies in rat (pre-2008)

- Volume predictions generally within 2-fold (range 1.2-1.9-fold, n= 118 compounds)
- General under-prediction of clearance (AFE 1.8 – 2.5-fold)
- Reasonable prediction of tissue levels
  - Parrott *et al*, J Pharm Sci, 94, 2327, 2005
  - De Buck *et al* DMD, 35, 649, 2007

Jones *et al*, Xenobiotica, 42, 94, 2012

- PBPK approaches used to simulate exposure for early toxicology studies
- More accurate than using linear scaling from low dose *in vivo* studies (n=39 compounds)

# How Successful are Human IVIVE-PBPK Strategies?

- Generally a pre-validation step was undertaken in pre-clinical PBPK models
- Human PBPK evaluated using HLM or Hep  $CL_{int}$  for IV & oral dosing
  - AUC,  $T_{max}$ ,  $C_{max}$ , F, CL,  $V_{ss}$  within two-fold for > 50% of compounds
    - Jones *et al.*, 2006, Clin PK, 45, 511, 2006 (n=19, *p.o*)
    - De Buck *et al.*, 2007, DMD, 35, 1766 (n=26, *i.v* & *p.o*)
    - Jones *et al.*, 2011, Clin PK, 50, 331 (n=20, *i.v*)

## PBPK vs. single species scaling (allometry) - Jones *et al.*, 2011

**Table V.** Global prediction accuracy of clearance (CL) using all approaches

Prediction measure	SSS from rat	SSS from dog	HLM <sup>a</sup>
% within 2-fold error [3-fold error] of observed value	63 [84]	78 [89]	67 [75]
Average fold error	1.8	1.7	2.0

a For CYP substrates only.

**CYP** = cytochrome P450; **HLM** = human liver microsomes; **SSS** = single-species allometric scaling.

CL predictions from HLM perform reasonably vs. Single Species Scaling (SSS)

# Accuracy of CL and CL<sub>int</sub> using IVIVE Methods

System	AFE	Reference
HLM	2.3	Obach DMD 27, 1350, 1999
	6.2	Ito, Pharm Res, 22, 103, 2005
	2.3	Stringer, Xeno, 38, 1313, 2008
	2.2	Ring, J Pharm Sci, 100, 490, 2011
	5	Hallifax, Pharm Res, 27, 2150, 2010
	2.0	Jones, Clin Pk, 50, 311, 2011
Hepatocytes	2.4	De Buck DMD, 35, 1766, 2007
	5.2	Stringer, Xeno, 38, 1313, 2008
	5.0	Hallifax 2011
	7.6	Naritomi DMD 31, 580, 2003
Recombinant CYP	1.53 PT, 2.15 WS	Stringer DMD, 37,1025, 2009

**Generally many literature studies *shows under-prediction* from in vitro systems  
Correct using an *empirical scaling factor* – Specific to your system!**

# Correction Factors to Improve IVIVE for Clearance

Hallifax and Houston, J Pharm Sci, 2012, 101, 2645

Eq 1

Eq 2

Eq 3

**Table 4.** Comparison of methods (Conventional, Berezkhovskiy, Poulin and Bias-Corrected Conventional) for *in vivo* CL<sub>int</sub>, in terms of precision of prediction (root mean squared error) and fitted log-linear relationship parameter values, for hepatocytes and microsomes

<i>In vitro</i> System	<i>In vivo</i> Calculation Method	<i>n</i>	RMSE	Slope	Intercept	<i>r</i>
Hepatocytes	Conventional	89	0.82	0.51	0.30	0.73
	Berezkhovskiy	89	0.79	0.47	0.42	0.66
	Poulin	89	0.63	0.48	0.57	0.71
	Conventional (bias corrected)	89	0.59	0.51	0.88	0.73
Microsomes	Conventional	64	0.93	0.80	-0.29	0.81
	Berezkhovskiy	64	0.84	0.97	-0.31	0.79
	Poulin	64	0.69	0.79	0.079	0.80
	Conventional (bias corrected)	64	0.63	0.80	0.40	0.81

**Conventional bias correction method was superior**

## Commentary

### Clearance Prediction Methodology Needs Fundamental Improvement: Trends Common to Rat and Human Hepatocytes/Microsomes and Implications for Experimental Methodology

F. L. Wood,<sup>1</sup> J. B. Houston, and D. Hallifax

Centre for Applied Pharmacokinetic Research, Division of Pharmacy and Optometry, School of Health Sciences, Faculty of Biology, Medicine and Health, University of Manchester, Manchester Academic Health Science Centre, Manchester, United Kingdom

Received June 13, 2017; accepted September 6, 2017

TABLE 3

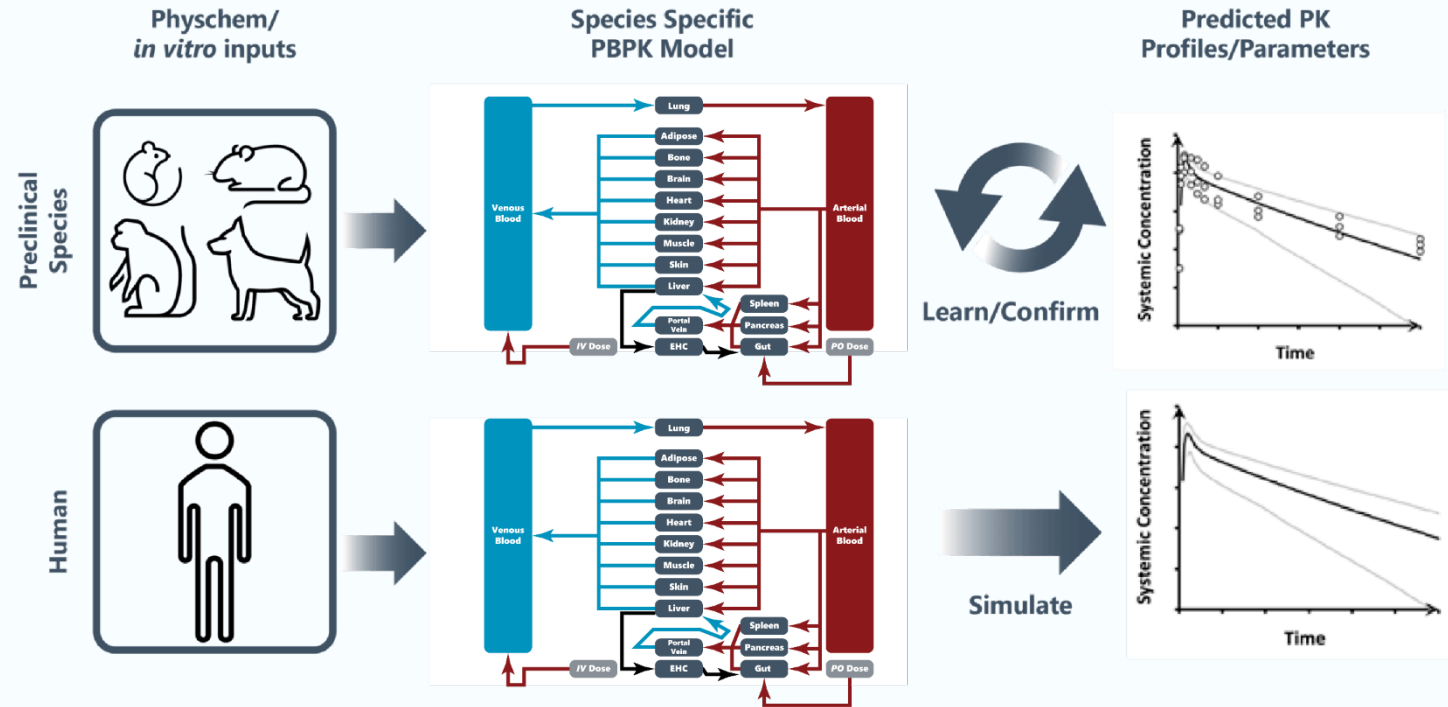

Average individual ESF for predicted CL<sub>int,u</sub> according to level of observed CL<sub>int,u</sub> for human and rat hepatocytes and liver microsomes

Observed CL <sub>int,u</sub>	ESF							
	Human				Rat			
	Hepatocytes		Microsomes		Hepatocytes		Microsomes	
	Log Average	<i>n</i>	Log Average	<i>n</i>	Log Average	<i>n</i>	Log Average	<i>n</i>
<i>ml/min/kg</i>								
<10	0.61	21	0.70	17	0.13	3	0.086	3
10-100	3.9	32	1.8	20	1.6	12	0.83	8
100-1000	7.1	40	4.6	34	3.2	67	1.7	34
1000-10,000	22	6	7.5	10	7.2	37	2.5	20
>10,000	1200	2	58	2	180	9	230	6

**ESFs to account for underprediction in rat & human  
Works well across projects**

# Applications of PBPK modelling in Discovery

## FIH Dose Prediction

Predict plasma and tissue concentration profiles across species and in humans -> link to PD models

Mechanistic approach with good IVIVC with minimal in vivo data

## Compound Triage and Pipeline Optimization

Defining laboratory objectives:

Compound ranking and selection:

	CPD 1	CPD 2	CPD 3
CL	5	10	8
Potency	1	2	4
Dose	5	20	32

# Applications of PBPK modelling in Discovery contd.

## Early DDI Screening

Uses regulatory guidance (EMA, FDA, PMDA) equations to calculate DDI risk

At both perpetrator and victim level

### Static DDI Prediction Tool

Output to Excel

Basic (Cut-off) Models Mechanistic Static Model System Parameters

Dose (mg)  Molecular Weight (g/mol)  fup  I<sub>max</sub> (mg/L)

Competitive Inhibition Mechanism Based Inhibition Transporter Inhibition

K<sub>i</sub> (μM)  f<sub>mic</sub>

Click to Predict

R<sub>1</sub>   Interaction below thresholds (please see footnotes for cut-off criteria)

R<sub>1,gut</sub>   Interaction below thresholds (please see footnotes for cut-off criteria)

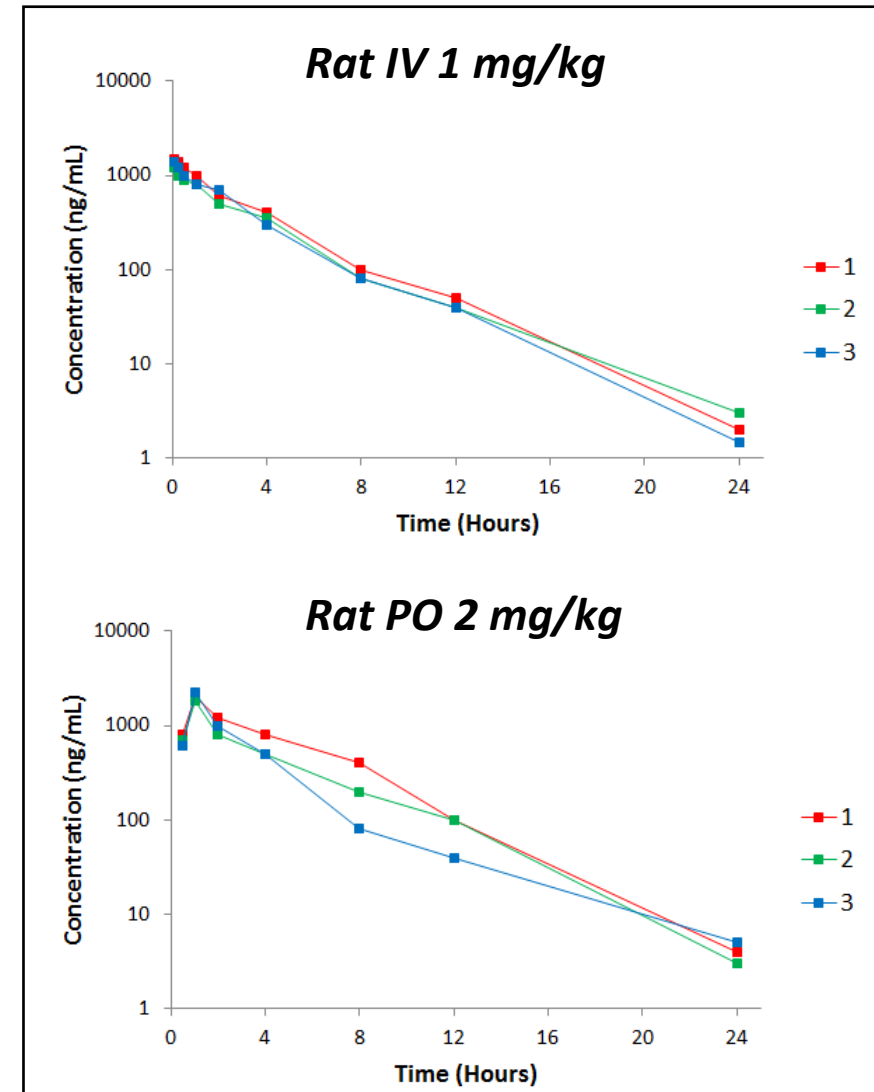

## Early Formulation Simulation

Sensitivity analysis to guide formulation design -> maximize exposure for tox /optimize formulation

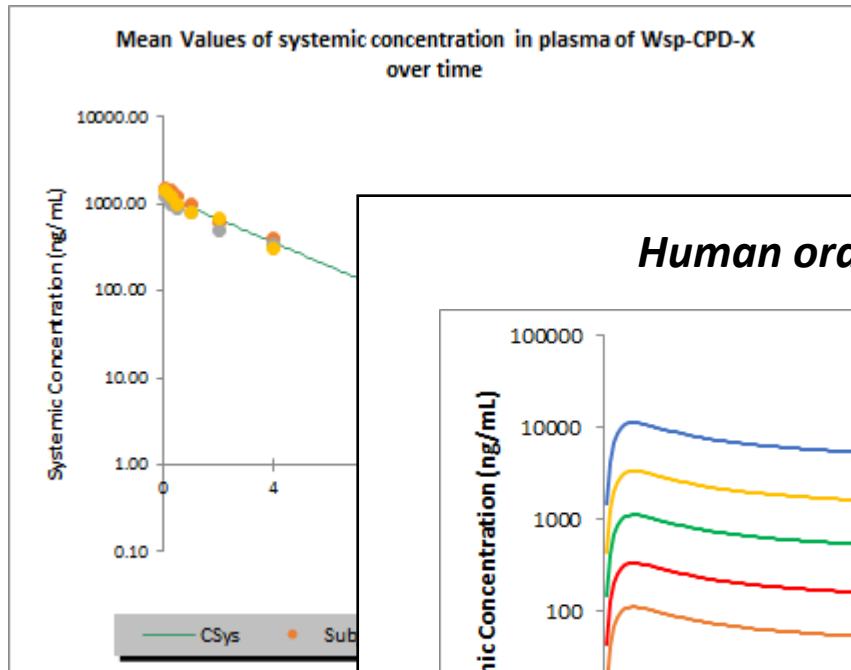

# Case Study: ADME properties and model input parameters

Parameter	Value
MW g/mol	500
LogP	3.4
Charge	neutral
fu in plasma	0.01 (R), 0.009 (D), 0.012 (H)
B/P ratio	assumed to be 1
Microsomal CLint $\mu\text{l}/\text{min}/\text{mg}$	100 (R), 70 (D), 50 (H)
fu,mic	0.5
Solubility mg/mL	0.2
Permeability	high - predicted from physchem

# Case Study – Preclinical model validation & FIH simulation

**Rat IV 1 mg/kg**

**Rat PO 2 mg/kg**

**Human oral simulation across a range of doses**

Dose (mg)	AUC (ng/mL.h)	CMax (ng/mL)	TMax (h)	t 1/2 (terminal) (h)
10	1257	113	1.00	17.64
30	3770	338	1.00	17.64
100	12567	1127	1.00	17.64

1000	125672	11274	1.00	17.64

	Basic static	Mechanistic static
CYP3A4	YES	YES
CYP1A2	YES	NO
P-gp	YES	YES

# General Guidance for PBPK modelling in Discovery Space

- Always perform pre-verification steps in preclinical species to build confidence in data and assumptions
- CL is generally underpredicted from in vitro systems – Wood scalar often incorporated to account for this with some success
- Explore a range of CL methodologies if uncertainty in CL mechanism
- $V_{ss}$ /distribution is generally well predicted across species → approach to compare tissue composition equations against  $V_{ss}$ ,  $u$  the same across species
- Permeability normally well predicted with using in vitro data or MechPeff model
- Explore aqueous solubility and biorelevant solubility to predict dissolution -> if data is limited consider using solution dosing

# Why use Simcyp Discovery?

- Allows integration of all available discovery data to provide an informed PK and dose projection with minimal data
- Allows scaling from in vitro data with minimal in vivo data
- Informs decision making at all stages of drug discovery
- Quick and easy to use

# Thank you

**Accelerating Medicines, Together**
