29 **1 Introduction**

30 *This document is aimed at users that need to set up the AS4 protocol in their organisations*  
31 *and need a basic understanding of how B2B communication using AS4 fits in IT*  
32 *environments. It explains, at a high level, the concepts of communication using the AS4*  
33 *protocol [AS4], describes the communication layer in an AS4 data exchange and explains the*  
34 *concept of a B2B Gateway. Some general requirements on B2B gateways are presented and*  
35 *the benefits of using a B2B gateway are explained. Finally, a sample deployment scenario is*  
36 *presented.*

37 *The purpose of this document is to provide general high-level information on B2B document*  
38 *exchange and its position in the enterprise IT landscape, and some AS4-specific information.*  
39 *Furthermore, it describes key steps that organisations need to take to implement AS4 in their*  
40 *organisation.*

41 *For AS4, the concept of Processing Modes is introduced and the various parameters that*  
42 *need to be configured to use AS4. For partner communication, three cases will be described:*  
43 *initial configuration of an AS4 gateway for communication with a partner; configuring a*  
44 *specific service for use with a partner; and updating existing partner configurations.*

45 *This document is informative only. It may be used as a guideline or good practice and*  
46 *provides some example setups, but does not mandate a particular way of implementing AS4.*  
47 *Parts of this document cover generic B2B communication topics that are not tied to any*  
48 *distinguishing feature of the AS4 protocol.*

49 *The audience for this document are IT managers, B2B integration project teams and IT*  
50 *infrastructure managements that are starting to implement AS4 in their organisations, with a*  
51 *focus on Transmission System Operators for gas that will implement the ENTSOG AS4 Usage*  
52 *Profile for TSO [AS4TSO]. It does not cover the AS4 standard or the ENTSOG usage profile in*  
53 *any detail.*

## 54 **2 AS4 Communication Concept**

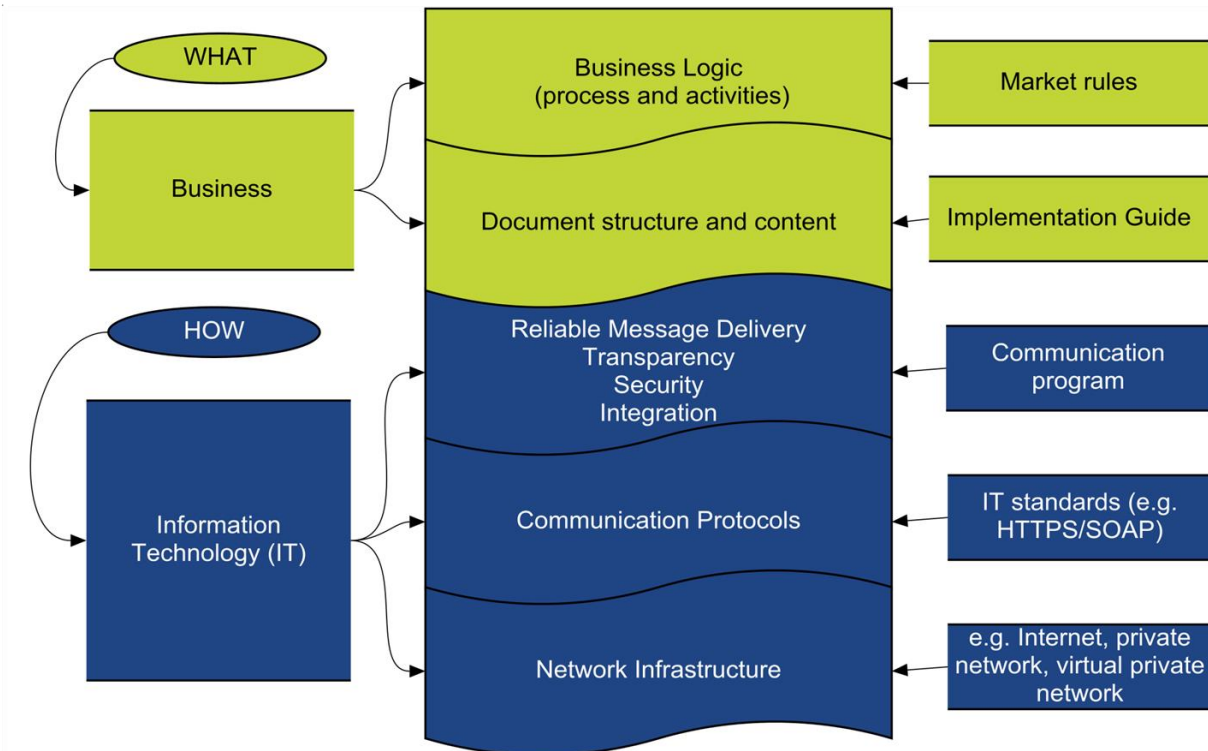

### 55 **2.1 Data Exchange Concepts**

56 The AS4 protocol supports the concept of *document-based* data exchange. This is a model  
57 where enterprises in a market collaborate and synchronise their business processes at  
58 specific agreed process steps. The synchronisation involves the exchange of information  
59 between enterprises as *business documents*. Documents are encoded in a structured format  
60 that is standardised in the sector (like EASEE-gas EDIG@S-XML) or otherwise agreed.  
61 Business documents are exchanged using B2B communication protocols (like AS4) using  
62 agreed implementation guidelines. The ENTSOG AS4 Usage Profile is an example of such an  
63 implementation guideline for AS4. Because of the requirements in the business processes it  
64 is needed to assure the integrity and identify the sender of the document, therefore security  
65 measures have to be taken and implemented.

66 In document-based data exchange, the exchanged information is produced and consumed  
67 by business applications. This is a key difference with paper-based communication,  
68 electronic mail or using Web portals, all of which require human intervention.

### 69 **2.2 Data Exchange Layers**

70 In data exchange, a distinction can be made between the business operational view (the  
71 *what*) and the IT functional service view (the *how*). Market rules and regulations determine  
72 the business process and activities, from which in turn the structure and content of the  
73 information to be exchanged follows. The Information Technology view is concerned with  
74 the exchange of information across a public or (virtual) private computer network using  
75 message exchange protocols. These layers can be visualised as in Figure 1.

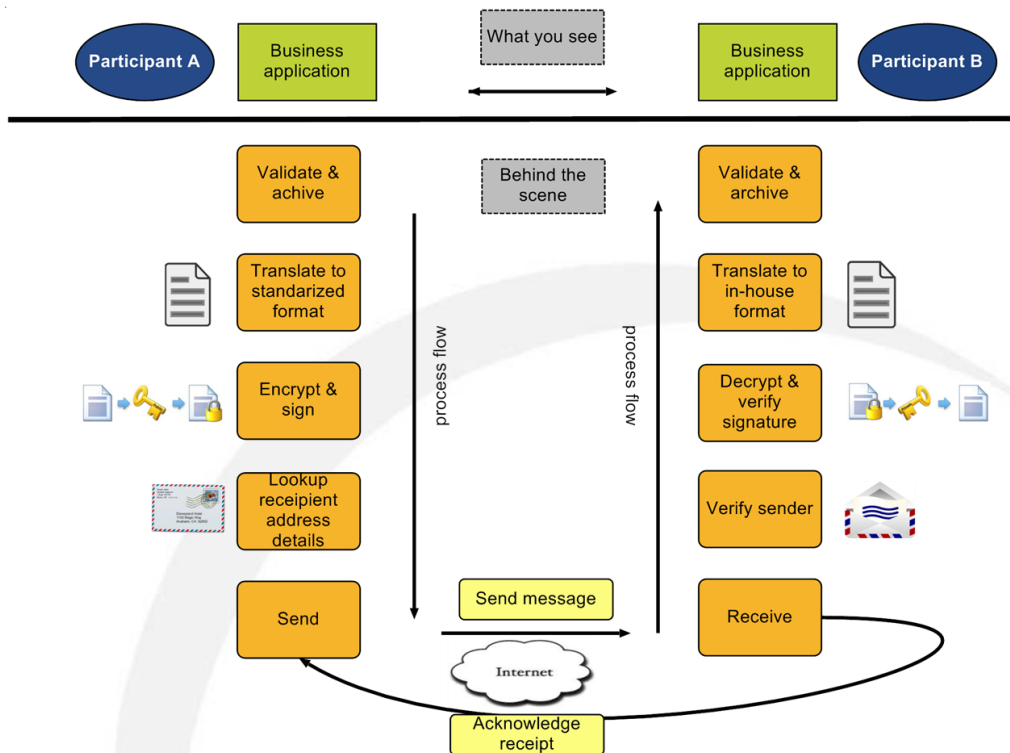

76  
77 **Figure 1 Data Exchange**

78 **2.3 B2B Gateway Concept**

79 It is a common practice in data exchange to not directly connect one's business applications  
80 to business applications of one's counterparties, but to use architectural components called  
81 *B2B Gateways*, which are responsible for document-based B2B data exchange. A B2B  
82 gateway serves as an intermediary between an enterprise and its communication partners.  
83 The concept of a B2B Gateway is sufficiently common that a class of commercial off-the-  
84 shelf software products and related services exists that can be used to implement such a  
85 gateway in general and communication protocols like AS4.

86 A B2B Gateway has an enterprise interface and a trading partner interface and supports  
87 bidirectional communication. On the enterprise side, the gateway behaves as an application  
88 in the enterprise IT landscape and should adhere to corporate standards and support to the  
89 enterprise's *private* processes. On the partner side, it functions as the partner interface and  
90 should conform to the partner community standards and its *public* processes. Whereas the  
91 enterprise side is under the control of the organisation and closed to (possibly malicious)  
92 third parties, the partner side is not. It involves the use of third party infrastructure and  
93 public networks and therefore security and reliability require special attention.

94 The processing of documents by B2B gateways and Enterprise Service Bus (ESB) or other  
95 middleware (if used) is typically not immediately visible to the end-user. The end-user may  
96 therefore still have the impression that communication is directly between applications. This  
97 is visualised in Figure 2.

98

99 **Figure 2 What the User Sees**

100 On the enterprise side The B2B Gateway can be connected directly to business applications  
 101 using a variety of mechanisms including enterprise communication protocols like FTP(File  
 102 Transfer Protocol) , messaging APIs like JMS, shared file systems or databases. However,  
 103 enterprises are increasingly adopting service-oriented concepts and integrating business  
 104 applications using an *Enterprise Service Bus* (ESB). In such a model, B2B communication is  
 105 exposed by the B2B gateway to the ESB, just like business applications expose business  
 106 services, and the gateway and applications are not directly connected.

107 **2.4 B2B Gateway Requirements**

108 A B2B gateway must support fully automatic processing. This means it must support the  
 109 exchange of structured business content as well as metadata to express the purpose and  
 110 requested processing.

111 A B2B gateway must also support secure and reliable communication, by protecting the  
 112 integrity and confidentiality of content, and to authenticate the identity of sender and a  
 113 receiver and to support non-repudiation of origin and receipt.

114 B2B Communication should be based on open standards, and independent of specific vendor  
 115 products. Transmission System Operators should be able to procure solutions in a  
 116 competitive environment. AS4 is such an open standard and is implemented by a variety of  
 117 solutions. The ENTSG AS4 Usage Profile provides additional detailed guidance and  
 118 interoperability; it limits the configuration options and usage to a defined set.

## 119 **2.5 Benefits of a B2B Gateway**

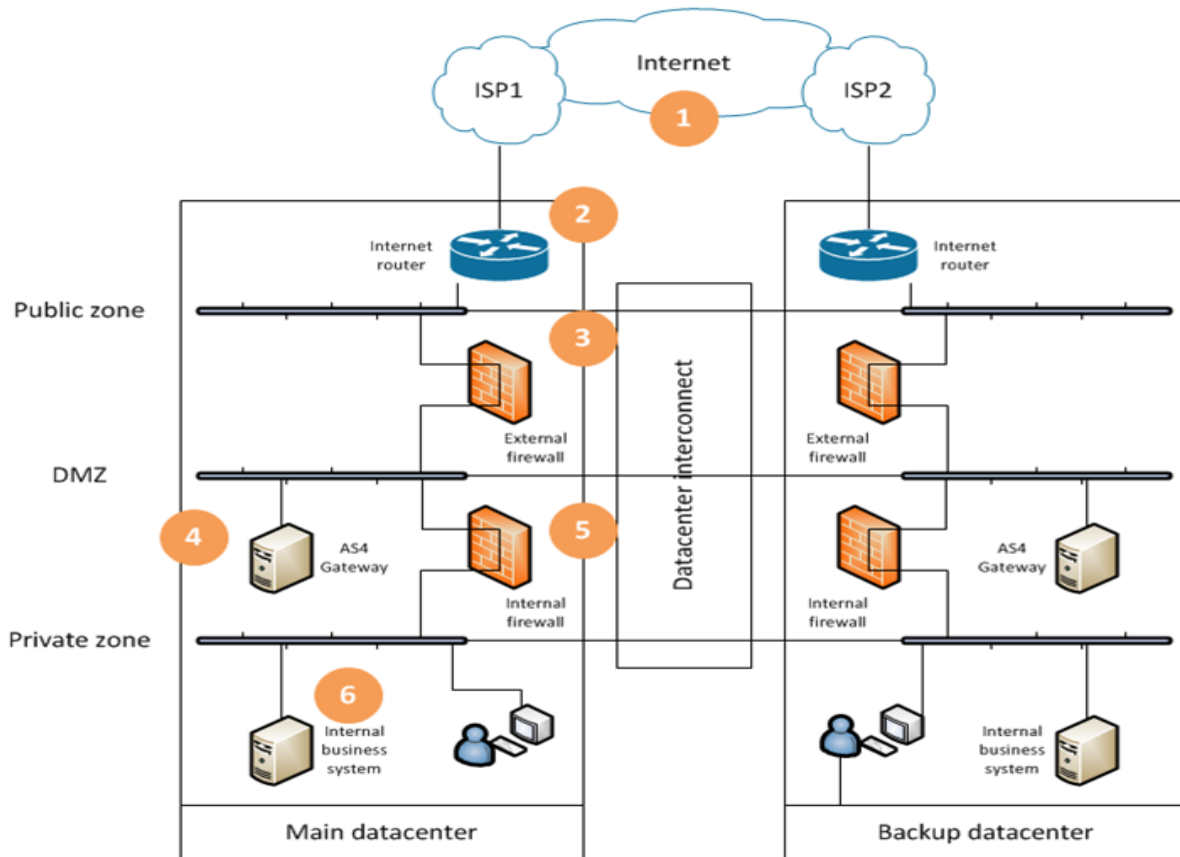

120 A B2B gateway decouples the IT systems of a party and its counterparty and therefore  
121 supports interoperability at the business process layer amongst organisations that use IT  
122 systems that may be very different. The decoupling covers a range of aspects:

- 123 • At the *network (security) layer*, the gateway is connected externally (to partner  
124 gateways) and internally (to enterprise IT), obviating the need for direct network  
125 connectivity between enterprise systems and partner systems. This simplifies  
126 configuration and management of partner connectivity. Only the gateway needs to  
127 know about IP addresses, ports and transport layer security configuration for specific  
128 partners.
- 129 • At the *application layer*, the gateway intermediates between internal systems and  
130 trading partners. Trading partner do not need to know which business application is  
131 responsible for handling specific messages, as the gateway (or ESB) is responsible for  
132 routing messages appropriately. AS4 support such routing by providing rich  
133 metadata.
- 134 • At the *communication protocol layer*, the gateway is responsible for selecting the  
135 communication protocol to use for a partner and message type. Communication may  
136 switch from older protocols to newer (e.g. from AS2 to AS4) without any the need for  
137 reconfiguring business applications. Similarly, an enterprise can drastically change its  
138 internal integration (e.g. introducing an ESB or switching from one type of  
139 middleware to another) without impacting its trading partner.
- 140 • At the *business content layer*, some B2B gateway products support the mapping of  
141 document formats, or version of formats. For example, they may transform XML to  
142 in-house formats or transform one type of XML to another. (In some ESBs, this  
143 transformation may itself be a service that is invoked from the ESB rather than the  
144 gateway).

## 145 **2.6 Sample AS4 Gateway System Perspective**

146 A sample deployment scenario for a B2B Gateway is displayed in Figure 3 Sample System  
147 Perspective. This diagram illustrates how an AS4 gateway may be implemented and may fit  
148 in an enterprise IT landscape, not precluding other possible alternative architectural options.

149

150

151 **Figure 3 Sample System Perspective**

152 The AS4 gateway, in this sample scenario, is separated from the Internet by an External  
153 Firewall, which is configured to allow communication with communication partners, for  
154 which the IP addresses are known. A separate firewall separates the AS4 Gateway from the  
155 organisation's internal business systems (possible connected using an ESB or other  
156 middleware) and end user computers. No direct communication is possible from external  
157 systems to the internal systems.

158 The diagram also shows the use of a backup data centre, which mirrors the main datacentre.  
159 It has a separate Internet connection and an AS4 gateway that can take over from the main  
160 gateway for failover. Of course measures should be taken towards the internal business  
161 systems to synchronise between main and backup datacentres in order to guarantee  
162 business continuity and no loss of data. In case of a switchover, the partners should not need  
163 to change anything in their systems. Established mechanisms exist to handle such events.  
164 They are not dependent on AS4 or B2B messaging in general, and will therefore not be  
165 elaborated on in this document. The approach illustrated in this diagram is a good practice  
166 of a so-called active-passive cluster configuration.

167 Another option is to deploy multiple gateway server instances in parallel in a so-called  
168 active-active cluster configuration. The server address communicated to communication  
169 partners is the address of a load balancer that forwards incoming messages to the various

170 server nodes. Outgoing messages will still be sent directly from the cluster nodes to  
171 communication partners. In addition to providing continuity in case of failure of some cluster  
172 node (as in the active-passive model), this allows the cluster to scale out to process message  
173 volumes that are larger than a single AS4 gateway instance could process.

174 When deploying a gateway product in a cluster, similar consideration apply to supporting  
175 infrastructure such as databases and file systems used by the gateway.

## 176 **3 Deploying AS4**

177 When implementing AS4, a number of steps need to be taken; some necessarily in sequence  
178 (due to dependencies) but others may be taken in parallel. Some are to be taken once, but  
179 others need to be revisited if certain events or changes occur.

### 180 **3.1 *Selecting an AS4 Gateway***

#### 181 **3.1.1 AS4 Gateways**

182 To implement AS4, an organisation needs to deploy an AS4 gateway product, which is a B2B  
183 gateway (see section 2.3) that supports AS4. As AS4 is an open standard [AS4], organisations  
184 are in principle free to choose any conformant product that is interoperable with other  
185 available AS4 products used in the community and that otherwise meets the business or  
186 technical requirements of the organisation. Reasons for preferring one product over the  
187 other may include compatibility with other IT applications or frameworks, established  
188 vendor relations or commercial considerations and will lead to different choice in different  
189 organisations.

#### 190 **3.1.2 Support for ENTSOG AS4**

191 To support the practical implementation in the gas community, ENTSOG publishes a Usage  
192 Profile of AS4 on its public Internet site [AS4TSO] that reduces the feature set to be  
193 implemented by the AS4 product and provides interoperability guidelines. When contacting  
194 potential suppliers of AS4 solutions, users are strongly recommended to ask the vendor to  
195 provide a formal assurance that their solution fully and correctly implements this profile and  
196 can demonstrate experience in using its product interoperably with other vendor products.  
197 Some vendors participated in the ENTSOG interoperability proof-of-concept in 2014 and  
198 successfully demonstrated interoperability [AS4POC]. Since then, other vendors have  
199 implemented the profile as well. Today, many AS4 products have been successfully deployed  
200 by TSOs and are used in production.

201 The ENTSOG AS4 Profile is closely related to the eDelivery AS4 profile maintained and  
202 promoted by the European Commission [EDELAS4]. The eDelivery AS4 profile consists of a  
203 Common Profile and a number of optional Profile Enhancements. The Common Profile  
204 feature set corresponds to a large subset of ENTSOG AS4. For all purely technical  
205 parameters, including message and transport layer security features and algorithms,  
206 message exchange patterns and pattern bindings, error handling, reliable messaging, and  
207 compression, the Common Profile and ENTSOG AS4 are the same. Therefore,  
208 implementations of the eDelivery AS4 Common Profile have to provide most of the features  
209 used in ENTSOG AS4. ENTSOG AS4 extends the Common Profile by providing an ENTSOG-  
210 specific Usage Profile and by requiring (since version 3.5) support for a separate specification  
211 called ebCore Agreement Update [AU]. An implementation that is not yet used for ENTSOG  
212 AS4, but correctly supports the eDelivery AS4 Common Profile, is quite close to meeting at  
213 least the majority of technical features required for ENTSOG AS4.

### 214 **3.1.3 ENTSOG AS4 Conformance**

215 In the experience of ENTSOG members, some AS4 products (including products marketed to  
216 companies in the gas market in Europe) do not (yet) support all the features mandated in  
217 the ENTSOG AS4 Usage Profile or do not support them interoperably. Users are  
218 recommended to obtain information from their (prospective) suppliers regarding  
219 (non)compliance to the ENTSOG AS4 profile and/or (lack of) interoperability with other AS4  
220 solutions specifically for the ENTSOG AS4 Usage Profile.

221 Conformance testing of a technical specification by a neutral third party helps solution  
222 providers (and any end users that develop their own implementation) to test that their  
223 implementations correctly implement the specification. By retesting their implementation  
224 after fixing any bugs found in testing, they can demonstrate improvements to their product.  
225 By retesting updated versions of implementations, they can verify that those updates do not  
226 introduce any new conformance issues.

227 The European Commission offers an eDelivery conformance testing service [EDELAS4CT]. For  
228 ENTSOG, of relevance is the conformance testing for two test modules:

- 229 • A module for the eDelivery AS4 Common Profile. This service is available now.
- 230 • A module for the ENTSOG AS4 Usage Profile. This service is available from Q1 2019  
231 and has been developed with input from ENTSOG.

232 Due to the similarities between ENTSOG AS4 and eDelivery AS4 (see section 3.1.2), any AS4  
233 implementation marketed to ENTSOG members for use with ENTSOG AS4 should be able to  
234 successfully pass the tests in the eDelivery AS4 Common Profile. The newer separate  
235 module for the ENTSOG AS4 Usage Profile tests some additional features used in ENTSOG  
236 AS4, providing even more complete feature conformance. There is currently no test module  
237 for ebCore Agreement Update [AU].

238 Note that conformance is a different concept from interoperability. Two products that are  
239 both conformant to a specification are likely, but not guaranteed to, interoperate. However,  
240 for ENTSOG AS4 experience is that interoperability issues encountered so far are caused  
241 caused by either non-conformance to ENTSOG AS4 of at least one of the implementations,  
242 or of incorrect or inconsistent configuration.

### 243 **3.2 Initial Deployment**

244 The initial deployment of an AS4 gateway consists of the installation of the AS4 gateway  
245 software, internal integration (within the enterprise) and preparations for external  
246 integration (to the communication partners). Installation of an AS4 gateway is done in a  
247 particular environment (single server or cluster) and involves some initial software  
248 configuration. For example, the gateway may require a database for which the connection  
249 properties need to be set.

250 The result of the initial deployment is an AS4 gateway to which message payload and  
251 metadata can be submitted, which can deliver received payloads and metadata, and which

252 has a basic configuration (known server URL, IP address, certificates) to enable  
253 communication with partners.

254 Note that this initial installation and configuration step typically needs to be repeated for  
255 each environment the software is deployed in (e.g. test, pre-production, production).

### 256 **3.2.1 Internal Integration**

257 On the *internal integration* side (integration with business applications and/or middleware  
258 within the enterprise), any AS4 product offers interfaces to *submit* messages produced by  
259 enterprise applications to be sent to B2B partners and to *deliver* messages received from  
260 B2B partners to an internal consumer. The AS4 standard defines abstract operations for  
261 submitting and delivery, but the actual implementation is product-dependent.

262 B2B products often offer multiple interfaces, such as shared folders, APIs for certain  
263 programming languages, JMS or other enterprise messaging systems, FTP or other transport  
264 protocols, SOAP etc. Which of these an organisation should use typically depends on the  
265 approach to enterprise integration in an organisation. Many organisations adopt Enterprise  
266 Service Bus (ESB) technology to connect their business applications. In these organisations,  
267 the AS4 gateway should be connected to the ESB and use ESB services, rather than be  
268 connected to business applications directly, though the latter is an option.

269 When submitting payloads to be sent, a B2B gateway typically needs some metadata to  
270 know how to process the data, in particular minimally the intended recipient. Using the  
271 party identifier of the recipient, the endpoint of the recipient and other relevant parameters  
272 are retrieved from configuration so the message can be sent. Compared with other protocols  
273 like AS2, more metadata may be required for AS4 beyond the recipient party identifier, such  
274 as the *Service* to be addressed. The Usage Profile describes this and specifies how this  
275 metadata can be extracted (or inferred, using lookup tables) from EDIG@S content. To reuse  
276 unmodified enterprise software applications, this metadata handling should be done in an  
277 ESB or other middleware service. This metadata allows the AS4 gateway to determine the  
278 processing mode to apply to the message. For more information on the concept of  
279 “processing modes” in AS4, see section 3.3.

### 280 **3.2.2 External Integration**

281 On the *external integration* side (integration with partners), AS4 gateway products may  
282 terminate AS4 communication from the public zone directly (as in Figure 3), or use a  
283 separate Web Server or other networking software or hardware (such as an XML Appliance).  
284 To be accessible, the AS4 gateway must be resolvable via the Internet Domain Name Service  
285 (DNS) using a static IP address. While DNS configuration changes are simple changes, they  
286 should be addressed early in the project as in large organisations they may involve different  
287 departments and change processes can take time.

288 Like other B2B protocols, AS4 and the ENTSOG Usage Profile rely on X.509 Digital Certificates  
289 for message-layer sender and receiver authentication, non-repudiation and confidentiality  
290 and for server (and optionally client) authentication at transport layer. The Usage Profile  
291 defines requirements on certificates to be used but does not currently mandate a specific

292 Certificate Authority. Many TSOs and partners use certificates issued by EASEE-gas for use  
293 with AS2. In principle, these certificates can also be used with AS4 and will be readily  
294 accepted as many organisations are used to working with EASEE-gas certificates.  
295 Organisations that want to deploy certificates from other Certificate Authorities should be  
296 aware that their counterparties may ask them to provide evidence that these authorities are  
297 trustworthy and comply with the requirements defined in the Usage Profile section 2.3.4.5.  
298 Their counterparties may find it difficult to accept certificates from authorities in case no  
299 such evidence is provided or in case any evidence provided is difficult to verify. The latter is  
300 the case if the CA is a local certificate authority from a member state that is unknown  
301 outside the country and only publishes its certificate policy and other documentation in a  
302 local language. Organisations should also be aware that certificates issued by other  
303 Certificate Authorities may have various interoperability issues.

### 304 **3.3 Processing Modes**

305 In AS4, a “Processing Mode (or P-Mode) is a collection of parameters that determine how  
306 messages are exchanged between a pair of MSHs with respect to quality of service,  
307 transmission mode, and error handling.

308 A P-Mode may be viewed and used in two ways:

- 309 • It is an agreement between two parties as to how messages must be processed, on  
310 both the sending and receiving sides. Both MSHs must be able to associate the same  
311 P-Mode with a message, as this is necessary for consistent processing (of security,  
312 reliability, message exchange pattern, etc.) end-to-end.
- 313 • It is configuration data for a Sending MSH, as well as for a Receiving MSH.

314 Several P-Mode instances may be used to govern the processing of different messages  
315 between two MSHs. A P-Mode is usually associated with a class of messages that is  
316 identified by some common header values – e.g. the class of messages sharing same values  
317 for *eb:Service*, *eb:Action*, and *eb:AgreementRef*.

318 More abstractly, a P-Mode is said to be *deployed* on an MSH when it is governing the  
319 processing of an associated class of messages on the MSH.” [EBMS3].

320 The process of configuring an AS4 gateway for communication between parties therefore  
321 involves the configuration of P-Modes for those parties. This sub-section explains the AS4  
322 concept of P-Modes and the various parameters. The next sub-section will explain how this  
323 fits into implementing ENTISO AS4, and in which situations this configuration needs to be  
324 reviewed and possibly updated.

325 Processing Mode parameters can be assigned to one of the following groups:

- 326 • The Sender of the message.
- 327 • The Receiver of the message.
- 328 • The Business Process.
- 329 • The Sender-Receiver pair.

- Use of specific AS4 features, and constraints on the use of those features.

The ENTSOG Usage Profile provides detailed additional guidance on how parameters for the various P-Modes are to be set. The following sub-sections describes these parameters and their values in more detail.

Note that products have their own interfaces and data formats for storing these parameters. The information in this section therefore must be mapped to the (product-specific) configuration mechanisms.

### 3.3.1 Party-related Parameters

AS4 encodes the sender and receiver party and party type identifiers in the message and has P-Mode parameters to specify these values. The ENTSOG AS4 profile requires the party ID values to be EIC codes and defines a fixed format for the Party type attribute.

Example of the use of these values in an AS4 header:

```
<eb3:PartyId type="http://www.entsoe.eu/eic-codes/eic-party-codes-x">21X-EU-A-X0A0Y-Z</eb3:PartyId>
```

For every party, the signing certificate must be recorded and shared. This certificate is used to sign AS4 messages for the party as a sender, and to sign receipts for the party as a receiver.

For every party that receives a user message (i.e. a message carrying some EDIG@S XML or other payload), in addition to a signing certificate an encryption certificate is needed. The sender uses this certificate to encrypt the message such that only the receiver is able to decrypt the message.

For each party that receives a message, the URL of the AS4 gateway must be specified and shared.<sup>1</sup> This URL starts with the <https://> prefix, because AS4 uses HTTP and ENTSOG AS4 requires TLS.

Within a community of companies exchanging gas business messages, parties act in particular roles. These roles constrain the types of documents that can be exchanged between parties. See below, section 3.3.2, for more related information.

Over time, a party uses one set of certificates during one time period and another in another time period. Therefore each party is associated, not with a signing certificate/encryption certificate pair, but with possibly multiple such pairs, each of which has an associated validity period. See below, section 3.3.3, for discussion.

---

<sup>1</sup> Note that, in theory, ebMS3 and AS4 allow party identifiers, certificates and URLs to be specified per P-Mode. For example, a party might use one certificate when sending one type of message to one party and another certificate to send one to another party. Or a receiver might receive AS4 messages of a particular type and/or from a particular sender on one URL and other messages on another URL. The Usage Profile currently does not preclude such more complex configurations and for simplicity these parameter values should be fixed for all P-Modes that use them.

### 360 3.3.2 Business Process-related Parameters

361 In AS4, the message reflects the business process, or service, that it relates to, by including  
362 *Service* and *Action* headers in the message. For ENTSOG AS4, the following cases can be  
363 distinguished:

- 364 • The Test service defined in section 2.3.6 of the ENTSOG profile. This should be the  
365 first service to configure when implementing ENTSOG AS4. This service uses a fixed  
366 combination of *Service* and *Action* values defined in the ebMS3 standard. More  
367 information on configuring the P-Mode for the test service is given below, in section  
368 3.4.1. The test service uses the ebMS3 default roles.
- 369 • Gas business services as defined in EDIGAS. The ENTSOG AS4 profile describes the  
370 values to use for *Service* (in section 2.3.1.2.1), *Action* (in section 2.3.1.2.2) and  
371 initiator and responder *Role* (in section 2.3.1.2.3). Specifically, it states that the  
372 values are to be taken from the ENTSOG AS4 Mapping Table [AS4MT]. The values of  
373 this table that are relevant to a party are those in which the sender or receiver *Role* is  
374 (one of) the role(s) of the company. More information on configuring these services  
375 is given below, in section 3.4.2. In the table, the *Action* is constrained to be the AS4  
376 default action. The *Service* reflects the process area. The *Role* reflects the roles of the  
377 parties in the process.
- 378 • Since version 3.5, published in February 2017, the ENTSOG profile requires support  
379 for ebCore Agreement Update [AU]. That protocol defines its own *Service* and *Action*  
380 values. This allows these update messages to be routed to the service responsible for  
381 managing the configuration of the AS4 service. More information on configuring  
382 these services is given below, in section 3.4.3.

383 The various combinations of *Service*, *Action* and *Role*, and directionality of these messages,  
384 require separate P-Modes to be configured.

### 385 3.3.3 Sender, Receiver and Agreement

386 Some P-Mode parameters relate to both the Sender and the Receiver. The only such  
387 parameter used in the ENTSOG profile is *AgreementRef*, which identifies a particular  
388 agreement between those parties. In the ENTSOG profile, this agreement is just an identifier  
389 of a particular set of P-Modes, valid in a particular validity period. It is configured in the  
390 PMode.Agreement parameter. The ENTSOG AS4 Usage Profile defines a string format  
391 convention that combines the party identifiers and a version number. Example of the use of  
392 this value in an AS4 header:

393 `<eb3:AgreementRef>http://entsog.eu/communication/agreements/21X-EU-A-X0A0Y-Z/21X-EU-B-P0Q0R-S/3`  
394 `</eb3:AgreementRef>`  
395

396 Section 3.3.1 mentioned that parties are identified and associated with particular sets of  
397 certificates. The ENTSOG AS4 Usage Profile requires there to be a functional relation  
398 between agreements and a pairs of Sender/Receiver certificate sets. That is, each agreement  
399 is linked to a specific fixed specific pair of signing/encryption certificates for the sender and a

400 fixed specific pair of signing/encryption certificates for the receiver. Note that in an  
401 agreement, a party may be a sender for one type of message and a receiver for another. The  
402 agreement identifier indicates which set of values applies to message. The validity period of  
403 an agreement is constrained by the validity period of the certificates associated with it.

404 For example, agreement version 1 between P1 and P2 could valid from 1<sup>st</sup> of June 2016 to 1<sup>st</sup>  
405 of June 2019 and version 2 could be valid from 1<sup>st</sup> of May 2019 to 1<sup>st</sup> of May 2022.

406 Agreements 1 and 2 could then be exactly the same in all parameter values except for the  
407 certificates used. In May 2019 both the version 1 and version 2 agreement are valid. As the  
408 agreement identifier is a header element, each message unambiguously indicates which  
409 certificates it is expected to use.<sup>2</sup> Agreement 1 P-Modes uses one set of certificates, which  
410 must be valid in the validity period of the agreement, whereas Agreement 2 use another set  
411 of certificates that are valid in the validity period for Agreement 2.

### 412 3.3.4 Use of ebMS3/AS4 Features

413 The ebMS3 standard on which AS4 is based is a highly configurable protocol with many  
414 technical features and options. Some solutions aim to implement a large subset of ebMS3  
415 and therefore allow the user to select from a broad range of options, rather than  
416 constraining their product to a specific profile. In practice, most of these options are not  
417 used, because:

- 418 1. AS4 already profile the use of ebMS3. For example, the version of SOAP to be used  
419 is always SOAP 1.2, even though ebMS3 allows a choice of SOAP 1.1 or 1.2. Most  
420 ebMS3 products are focused on AS4 rather than on ebMS3 in general.
- 421 2. The ENTSG profile further narrows down the choices of AS4. For example, it  
422 specifies that all messages are secured using WS-Security (in ebMS3, this is optional);  
423 and moreover, that all messages are encrypted using XML Encryption; and  
424 moreover, that the AES-128-GCM algorithm is used for that encryption.

425 A succinct overview of AS4 P-Mode parameters for the ENTSG AS4 is provided in chapter 4  
426 of the ENTSG AS4 Usage Profile. This table is a summary of the Usage Profile. An excerpt of  
427 the table is in Figure 4.

---

<sup>2</sup> Note that this requires ENTSG AS4 compliant solutions to use this header in the selection of the P-Mode to use when sending or receiving a message. Implementers are encouraged to check with any (prospective) supplier of their AS4 solution that they meet this requirement.

P-Mode Parameter	Profile Value
PMode[1].Security.X509.Signature.Certificate	Signing Certificate of the Sender
PMode[1].Security.X509.Signature.HashFunction	<a href="http://www.w3.org/2001/04/xmlenc#sha256">http://www.w3.org/2001/04/xmlenc#sha256</a>
PMode[1].Security.X509.Signature.Algorithm	<a href="http://www.w3.org/2001/04/xmldsig-more#rsa-sha256">http://www.w3.org/2001/04/xmldsig-more#rsa-sha256</a>
PMode[1].Security.X509.Encryption.Encrypt	True
PMode[1].Security.X509.Encryption.Certificate	Encryption Certificate of the Receiver
PMode[1].Security.X509.Encryption.Algorithm	<a href="http://www.w3.org/2009/xmlenc11#aes128-gcm">http://www.w3.org/2009/xmlenc11#aes128-gcm</a>

428

429

Figure 4 Part of the P-Mode Parameter Table in ENTSSOG Usage Profile

430

Other sections of the profile provide additional explanation for these parameters. For

431

examples, the following excerpt of the security section describes this in textual form, which

432

the P-Mode table summarizes.

335 This ENTSSOG AS4 profile uses the following AS4 parameters and values:

336

- 337 • The **PMode[1].Security.X509.Sign** parameter MUST be set in accordance with section 5.1.4 and 5.1.5 of [AS4].
- 338 • The **PMode[1].Security.X509.Signature.HashFunction** parameter MUST be set to <http://www.w3.org/2001/04/xmlenc#sha256>.
- 339
- 340 • The **PMode[1].Security.X509.Signature.Algorithm** parameter MUST be set to <http://www.w3.org/2001/04/xmldsig-more#rsa-sha256>.
- 341

342 This anticipates an update to the AS4 specification to reference this newer specification that

343 has been identified as part of the OASIS AS4 maintenance work. For encryption, WS-Security

344 leverages the W3C XML Encryption recommendation. The following AS4 configuration

345 options configure this feature:

- 346 • The **PMode[1].Security.X509.Encryption.Encrypt** parameter MUST be set in
- 347 accordance with section 5.1.6 and 5.1.7 of [AS4].

- 348 • The parameter **PMode[1].Security.X509.Encryption.Algorithm** MUST be set to
- 349 <http://www.w3.org/2009/xmlenc11#aes128-gcm>. This is the algorithm used as value
- 350 for the *Algorithm* attribute of *xenc:EncryptionMethod* on *xenc:EncryptedData*.

351 AS4 also references an older version of XML Encryption than the current one ([XMLENC])

433

435

### 3.4 How to set up a Connection

436

#### 3.4.1 Initial Configuration of a Communication Partner

437

After the initial deployment of the AS4 system at a company, the next step is to connect the

438

AS4 gateway to the company's communication partners. This involves exchanging essential

439

configuration parameter sets with the partners, such as: the organisation's party identifier,

440

certificates, endpoint URL, and inbound and outbound IP addresses (or address ranges), and

441

the same parameter set for the counterparty.

442

Firewalls must be configured to allow incoming connections from communication partners.

443

In some organisations, outgoing connections (from all AS4 cluster nodes) must also be

444

explicitly allowed. While, like DNS changes, firewall configuration changes are simple

445

changes, they should be addressed early in the project as in large organisations they often

446

involve different departments and service management change processes can be time-

447

consuming.

448 When using AS4, communication with a partner is configured using P-Modes. As first  
449 mentioned above, under 3.3.3, several P-Modes can be grouped under an “agreement”.  
450 Section 2.3.2 of the ENTSOG A4 profile defines a convention for agreement identifiers that  
451 includes the party identifiers, sorted alphabetically, and a version number. By convention,  
452 the version number of the first agreement with a partner is “1”.

453 Before using the established configuration for any “real” (gas business) service, it is  
454 important to test it is configured properly. Taking advantage of its richer metadata (*Service*  
455 and *Action* headers), AS4 has a useful mechanism that allows partners to determine if their  
456 AS4 gateways can successfully exchange messages: the *test* service. This service is defined in  
457 section 5.2.2 of [AS4] and further described in section 2.3.6 of the ENTSOG Usage Profile for  
458 TSOs [AS4TSO]. The first P-Modes to configure for a new partner therefore relate to the use  
459 of this service.

460 A (hypothetical) P-Mode for a test message from the first party in the ENTSOG EIC code table  
461 (as published in September 2016 at <http://www.entsog.eu/eic-codes/eic-party-codes-x>),  
462 which has identifier 21X-AT-A-A0A0A-T to the second, which has EIC value 21X-AT-B-A0A0A-  
463 K, is provided in Table 1 below.

Parameter	Value
PMode.Agreement	<a href="http://entsog.eu/communication/agreements/21X-AT-A-A0A0A-T/21X-AT-B-A0A0A-K/1">http://entsog.eu/communication/agreements/21X-AT-A-A0A0A-T/21X-AT-B-A0A0A-K/1</a>
PMode.Initiator.Party	21X-AT-A-A0A0A-T
PMode.Initiator.Party Type	<a href="http://www.entsoe.eu/eic-codes/eic-party-codes-x">http://www.entsoe.eu/eic-codes/eic-party-codes-x</a>
PMode.Initiator.Role	<a href="http://docs.oasis-open.org/ebxml-msg/ebms/v3.0/ns/core/200704/initiator">http://docs.oasis-open.org/ebxml-msg/ebms/v3.0/ns/core/200704/initiator</a>
PMode.Responder.Party	21X-AT-B-A0A0A-K
PMode.Responder.Party Type	<a href="http://www.entsoe.eu/eic-codes/eic-party-codes-x">http://www.entsoe.eu/eic-codes/eic-party-codes-x</a>
PMode.Responder.Role	<a href="http://docs.oasis-open.org/ebxml-msg/ebms/v3.0/ns/core/200704/responder">http://docs.oasis-open.org/ebxml-msg/ebms/v3.0/ns/core/200704/responder</a>
PMode[1].Protocol.Address	<a href="https://hypothetical.url.at.example.com/as4">https://hypothetical.url.at.example.com/as4</a>
PMode[1].BusinessInfo.Service (No Service Type for this Service)	<a href="http://docs.oasis-open.org/ebxml-msg/ebms/v3.0/ns/core/200704/service">http://docs.oasis-open.org/ebxml-msg/ebms/v3.0/ns/core/200704/service</a>
PMode[1].BusinessInfo.Action	<a href="http://docs.oasis-open.org/ebxml-msg/ebms/v3.0/ns/core/200704/test">http://docs.oasis-open.org/ebxml-msg/ebms/v3.0/ns/core/200704/test</a>
PMode[1].Security.X509.	..

Signature.Certificate	
PMode[1].Security.X509. Encryption.Certificate	..

464 **Table 1 P-Mode for Test Service from 21X-AT-A-A0A0A-T to 21X-AT-B-A0A0A-K**

465 Note that this P-Mode only configures test messages from 21X-AT-A-A0A0A-T to 21X-AT-B-  
466 A0A0A-K. A separate P-Mode is needed to configure test messages in the reverse direction.

467 Support of the test feature is mandated in section 2.3.6 of the ENTSOG Usage Profile for  
468 TSOs [AS4TSO]. If a party is able to successfully send an AS4 *test* message to a counterparty  
469 and receive a corresponding AS4 receipt, and if the counterparty is similarly able to access  
470 the *test* service of the party, both party and counterparty know their AS4 configuration  
471 (party identifiers, endpoints, certificates) and network configurations (firewalls) are  
472 consistent and fully functional. In AS4, the *test* service is a service like any service except that  
473 AS4 *test* messages are never delivered to any business service but are consumed internally in  
474 the AS4 gateway. Therefore implementers can assume that no data is ever accidentally  
475 delivered to any business application in any environment.

476 Note that if an organisation deploys multiple AS4 Gateways for different services behind an  
477 XML routing appliance (or similar component), using the *test* service only tests connectivity  
478 to the gateway that handles the test service. This may be acceptable if all gateways are  
479 synchronised to use the same certificate set.

480 If it is necessary to test connectivity to all such gateways, another header field could be  
481 configured for routing at the appliance (such as *AgreementRef*) to route to a specific  
482 gateway, as there is only one test service. Alternatively, it may be possible to configure the  
483 appliance to load-balance *test* service messages over all AS4 Gateways. The sender can then  
484 send a batch of messages to the *test* services to test that all gateways are functioning  
485 correctly, assuming eventually all gateways receive and reply to at least one test message.

486 It should be noted that if the Communication Partner has different AS4 Gateways for  
487 different environments (e.g. test, pre-production, production) this step needs to be done for  
488 each environment that needs to be connected with.

489 If more than one agreement is in place between two parties (as discussed in section 3.4.3,  
490 below), test service P-Modes are needed for each agreement.

### 491 **3.4.2 Configuring a Partner for a Business Service**

492 Once AS4 communication is successfully established with the corresponding environment of  
493 the counterparty using the *test* service, the AS4 gateway configuration can be extended to  
494 support additional services beyond the *test* service. The configuration for other services will  
495 be the same as the *test* configuration except for *Service*, *Action* and *Role* values. Unlike the  
496 *test* service, payload data will be delivered to enterprise service consumers of the  
497 counterparty rather than being consumed within counterparty's AS4 gateway.

498 As described in the ENTSOG Usage Profile [AS4TSO], information on the actual values to be  
499 used for services supporting specific business processes is provided by ENTSOG for the

500 business processes for which it provides Business Requirements Specifications (BRs) in the  
501 AS4 mapping table [AS4MT]. Table 2 shows a subset of the content in this table.

Edigas Process Area Value	AS4 Service	AS4 Action	Code	Party Role Value	Code	Party Role Value	Type Code

502  
503 **Table 2 Subset of ENTSG AS4 Mapping Table**

504 In the shown part of the table, a party that is a Transit System Operator (ZSO) may send  
505 messages in the A02 service to, and receive A02 messages from, other ZSO parties, as well as  
506 to/from SU, ZSH and ZSZ parties. For any particular ZSO, such as 21X-AT-A-A0A0A-T and 21X-  
507 AT-B-A0A0A-K, all or a subset of these values apply. Each of these rows relates to an AS4 P-  
508 Mode, if the exchange is a document-based exchange. Most of the parameter and values in  
509 these P-Modes would be identical to the settings for the test service shown in Table 1. For  
510 the exchange from ZSO to ZSO, Table 3 shows the five parameters that have different values  
511 from the ones in Table 1 are displayed.

Parameter	Value
PMode.Initiator.Role	ZSO
PMode.Responder.Role	ZSO
PMode[1].BusinessInfo.Service	A02
PMode[1].BusinessInfo.Service Type	<a href="http://edigas.org/service">http://edigas.org/service</a>
PMode[1].BusinessInfo.Action	<a href="http://docs.oasis-open.org/ebxml-msg/as4/200902/action">http://docs.oasis-open.org/ebxml-msg/as4/200902/action</a>

512 **Table 3 P-Mode for an EDIG@S Business Message (only differences with Table 2 shown)**

513 As noted before, if the Communication Partner has different AS4 Gateways for different  
514 environments (e.g. test, pre-production, production) in which the Service is implemented,  
515 there are likely to be different configuration for the various environments, in particular the  
516 endpoint address.

### 517 3.4.3 Updating Configurations and Certificates

518 The lifecycle of all service configurations needs to be managed, i.e. new services will be  
519 provided for existing counterparties, and new counterparties may emerge. Furthermore, it  
520 may be that an organisation changes one of its technical configuration parameters for AS4,

521 such as a server URL, a reliable messaging parameter, or an IP address. These changes need  
522 to be bilaterally agreed and coordinated.

523 A specific case is the update of X.509 certificates, because certificates have a fixed lifetime  
524 and need to be replaced when they expire. The EASEE-gas community has developed an  
525 approach to certificate replacement that assumes a coordinated change of all certificates in  
526 the community. Since version 3.5, the ENTSOG AS4 profile facilitates certificate updates,  
527 making it easier to apply them as needed rather than a pre-defined dates, support a phased  
528 transition, use AS4 to exchange the update information and allow the update to be  
529 automated (or as automated or manual as parties want it to be).

530 This improved certificate exchange process is based on ebCore Agreement Update [AU], a  
531 recently developed protocol to exchange update information using AS4 messages. When  
532 used with AS4, this protocol allows the creation of a new set of P-Modes, for a new  
533 agreement, that relate one-to-one to P-Modes in the previous agreement, and are identical  
534 except for the updates applied.

535 The Agreement Update protocol consists of three pre-defined messages to transmit, accept  
536 or reject updates. To allow an agreement to update itself, it must support these three  
537 messages. Since both parties in an agreement may initiate an update request, this means six  
538 P-Modes must be specified for every agreement.

- 539 1. Update request from P1 to P2
- 540 2. Update acceptance by P2
- 541 3. Update rejection by P2
- 542 4. Update request from P2 to P1
- 543 5. Update acceptance by P1
- 544 6. Update rejection by P1

545 Note that the P-Modes configuring these exchanges are themselves updated using the  
546 update protocol. This means the updated agreement can use the mechanism to update itself  
547 again, and so on. Version 3.5 of the Usage Profile provides all details for configuring these P-  
548 Modes.

### 549 **3.5 Using a Service Provider**

550 Some organisations do not operate a B2B Gateway themselves, but use communication  
551 services provided by a third party. For example, a service provider may provide a Protocol  
552 Bridge service to allow their customers to use other messaging protocols to communicate  
553 with them, and AS4 with their counterparties. If a service provider sends and receives AS4  
554 messages on behalf of an organisation, it is the service provider that is responsible for  
555 selecting and deploying the AS4 Gateway, external integration, partner configuration and  
556 maintenance of such configurations. When selecting a Service Provider, many AS4 specific  
557 considerations including conformance to the ENTSOG AS4 Profile (see section 3.1) apply to  
558 the service provider.

559 As the **Party** identifiers of an AS4 message relate to the communication partner, their values  
560 will identify the service provider and will be different from the issuer and recipient parties  
561 identified in the EDIG@S XML document, which will identify the business partner. This  
562 difference must be communicated to and agreed with the partners. To support this,  
563 organisations will need to implement a lookup mechanism to map business partner  
564 identifiers to communication partner identifiers. This is explained in the section “Party  
565 Identification” in the ENTSOG Usage Profile. This table also needs to be managed, because  
566 organisations may switch from one service provider to another, or may decide to in-source  
567 or out-source AS4 connectivity after the initial connections with partners are established.

568 **4 Revision History**

Revision	Date	Editor	Changes Made
Rev_0		PvdE	First Draft for discussion
Rev_1	17 Jul 2015	PvdE	<ul style="list-style-type: none"> <li>Published</li> </ul>
Rev_1.1	14 Sep 2016	PvdE	<ul style="list-style-type: none"> <li>Document Reviewed for updates</li> <li>Processing Modes details added</li> <li>Addition of details of Agreement Update Specification</li> <li>Reviewed at ITC KG 20 Sep 2016</li> </ul>
Rev_1.2	5 Oct 2016	PvdE	<ul style="list-style-type: none"> <li>Feedback incorporated from ITC KG 20 Sep 2016</li> </ul>
Rev_2	15 Nov 2016	JM	<ul style="list-style-type: none"> <li>Creation of Revision 2 for approval at ITC KG and INT WG, then publication</li> <li>All tracked changes accepted</li> </ul>
Rev_3	30 Nov 2018	PvdE	<ul style="list-style-type: none"> <li>Updated to reflect that Agreement Update is part of ENTSOG AS4 since 3.5.</li> <li>Added information on eDelivery AS4 and eDelivery AS4 conformance testing.</li> <li>Fixed some broken links.</li> </ul>
