ATTENTION: T. R. QUAY

SUBJECT: DRAFT AP600 PRA ATTACHMENT 54B - SURGE LINE FLOODING EFFECT ON SHUTDOWN PRA

Dear Mr. Quay:

A telecon was held between the NRC and Westinghouse on September 5, 1997, to discuss the AP600 shutdown PRA. Westinghouse agreed to an NRC-requested action during the telecon to provide four additional shutdown PRA sensitivity studies and to provide a justification for not requantifying the PRA given the recent change to the surge line flooding success criteria. A description of the additional sensitivity studies is provided as Attachment 6 to NRC's September 18, 1997, letter which summarized the telecon.

Enclosure 1 of this letter is a draft of Attachment 54B which will be placed at the end of AP600 PRA Chapter 54 in the next revision to the PRA report. Attachment 54B provides the four requested shutdown PRA sensitivity studies.

Enclosure 2 provides a page change correction to Section 54A.1 of Attachment 54A of the AP600 PRA. The changes presented in Enclosure 2 will be incorporated into the next revision of the PRA report.

Westinghouse believes Enclosure 1 satisfies the NRC-requested additional sensitivity studies. The telecon open item is represented by item #5751 in the OITS. Westinghouse will change the Westinghouse status column to "Action N" for the sensitivity study request, but will keep "Action W" for the requested justification for not requantifying the PRA to address the change to surge line flooding success criteria. The justification will be provided by separate letter. The staff is requested to review the enclosures and to provide Westinghouse with the action to be placed in the NRC status column of item #5751.

ATTACHMENT 54B

SURGE LINE FLOODING EFFECT ON LOW-POWER AND SHUTDOWN RISK ASSESSMENT

54B.1 Effect on Shutdown PRA, Revision 6

An examination of the surge line flooding concerns was conducted on the AP600 design to determine the capability of the IRWST gravity injection function during reduced inventory conditions if normal residual heat removal (RNS) cooling is lost.

The results of that examination indicated that, if RNS cooling is lost during reduced inventory conditions with the reactor coolant system open, a vent path through the ADS 4th stage is required to preclude the occurrence of surge line flooding and thereby not affect gravity injection.

Therefore, to address surge line flooding, Westinghouse has included the requirement for 1-out-of-4 ADS stage 4 valves to be opened, in the success criteria for events during reduced inventory conditions. This success criterion for 1-out-of-4 ADS stage 4 valves to be opened is determined by analyses documented in Section 4.8 of the AP600 Shutdown Evaluation Report, WCAP-14837, (Reference 54B-1). Technical Specification 3.4.14 allows for 2 of the 4 ADS stage 4 valves to be out of service during reduced inventory conditions. This technical specification provision is to allow for unscheduled repairs of as many as two ADS stage 4 valves during drained conditions.

Sensitivity studies are conducted to determine the effect of the additional ADS success criteria for surge line flooding on the shutdown PRA and basic insights obtained from Revision 6 of the shutdown PRA. All shutdown drained cases are affected by the surge line flooding issue. These cases are as follows:

IEV-RCSOD	RCS overdraining when entering mid-loop condition
IEV-LISPED	Loss of offsite power during mid-loop operation
IEV-RNSD	Loss of RNS during mid-loop operation
IEV-CCWD	Loss of CCS/SWS during mid-loop operation
IEV-LOCA24D	LOCA through RNS-V024 during mid-loop operation

The method of evaluating the effect of this success criterion on the shutdown PRA involves the following process:

- Include ADS stage 4 in the shutdown event trees for drained conditions. The revised event trees are provided in Figures 54B-1 through 54B-5.
- Construct two ADS fault trees: ADASD for cases with loss of offsite power available, and ADASDP for the station blackout case. The success criteria summary tables for these fault trees are provided in Tables 54B-1 and 54B-2.
- Evaluate the impact of these changes on the baseline and focused shutdown core damage frequencies.

Note, the shutdown PRA, Revision 6, reflects the conservative modeling of RNS trees in sequences associated with the loss of offsite power (LOSP) initiating event. This conservatism

consists of using an OR gate instead of an AND at the second level of the RNS fault tree files RNP2, RNT2, RNP2D and RNT2D. By correcting these fault tree files, the baseline core damage frequency changes from 5.5E-08 to 4.7E-08 events per year; the dominant core damage sequences with single RNS train failure from LOSP events are eliminated by these corrections. The corrected RNS fault tree files are used in this evaluation to resolve the surge line issue.

54B.1.1 Baseline PRA Shutdown Core Damage Frequency Sensitivity Results

By incorporating the changes discussed above into the shutdown PRA model, the baseline core damage frequency (CDF) changes from 4.7E-08 to 6.7E-08 events per year; an increase of 43 percent. However, a CDF of 6.7E-08 is still very low.

54B.1.2 Focused PRA Shutdown Core Damage Frequency Sensitivity Results

By incorporating the changes discussed above into the model from the shutdown PRA, Revision 6, the focused PRA sensitivity study core damage frequency changes from 4.1E-07 to 5.1E-07 events per year; an increase of 24 percent. However, a CDF of 5.1E-07 is still very low.

54B.2 Design Change Effect on Surge Line Sensitivity Studies

This section documents the effect of design changes on the baseline and focused PRA results from the surge line sensitivity studies addressed in the previous section (54B.1) of this attachment. The cutset output files for the results in subsections 54B.1.1 and 54B.1.2 form the starting point of these additional sensitivity studies.

These particular design changes, made subsequent to preparing the design reported in the shutdown PRA, Revision 6, are as follows:

1. IRWST injection check valves maintaining the RCS pressure boundary changed to squib valves; (i.e., check valves 123A/B and 125A/B are changed to squib valves 123A/B and 125A/B, respectively)
2. IRWST recirculation paths changed from 10-inch and 4-inch lines to 6-inch lines in all paths
3. IRWST motor-operated valves 118A & B and check valves 120A & B maintaining the IRWST water level changed to squib valves
4. CCS valves to the RNS heat exchanger changed from manual to air-operated
5. The capacity of the service water basin reduced; its duration changed from 24 hours to 12 hours
6. Service water system valves V037A & B changed from air-operated to motor-operated
7. The number of PRHR heat exchangers changed from two to one
8. RNS check valves V015A & B on the DVI lines changed to stop check valves.

This evaluation is an extension of the studies documented in Attachment 54A. The same basic event changes, shown in Attachment 54A, are made in these studies for the base cases. Additional

basic event changes related to the 4th stage ADS components and human error probabilities (HEPs) are made to perform sensitivity studies in addition to those in Attachment 54A.

In these studies, the effect of the design changes are evaluated together by performing the steps in Section 54A.9, but on the surge line-related cutset files. In other words, the sensitivity studies that assess the effect of each design change (as documented in Sections 54A.1 through 54A.8) are not performed in this exercise.

The sensitivity studies for this evaluation, consisting of the following cases, are documented in the subsections that follow:

- Case 1 - Effect of design changes on the baseline surge line core damage frequency
- Case 2 - Effect of design changes on the focused PRA sensitivity study surge line core damage frequency
- Case 3 - Effect on case 1 core damage frequency with single IRWST train and 2 ADS 4th stage valves operation
- Case 4 - Effect on case 1 core damage frequency when all HEPs are set to 0.5
- Case 5 - Effect on case 3 core damage frequency when all HEPs are set to 0.5.

54B.2.1 Case 1 Sensitivity Study - Effect on Baseline (Surge Line) Results

The Case 1 sensitivity study estimates the effect of the design changes on the baseline shutdown core damage frequency of $6.7E-08$, discussed above in subsection 54B.1.1.

This estimation is conducted by making changes to the basic events in the quantification output file from the surge line Level 1 baseline case. The following steps were done:

- a) Revise basic event probabilities associated with the new IRWST configuration and unscheduled maintenance unavailability discussed in subsection 54A.1; IWX-MV-GO1 is set to $2.6E-05$, IWX-CV-AO set to $3.0E-05$, IRWMOD05S set to $3.0E-03$, and IRWMOD06S is set to 0.
- b) Revise the basic event frequencies for CCS initiating events to reflect the changes discussed in subsection 54A.4; IEV-CCWD is set to $6.02E-04$, and IEV-CCWND set to $3.75E-03$.
- c) Revise the basic event frequencies for the loss of offsite power initiating events to reflect the changes discussed in subsection 54A.5; IEV-LISPED is set to $4.44E-03$, and IEV-LOSPND is set to $1.71E-02$.

Having modified the basic events to incorporate these design changes into the shutdown PRA, the baseline quantification output file is recalculated to estimate the shutdown core damage frequency. The resulting shutdown core damage frequency changes from $6.7E-08$ events per year to $7.0E-08$ events per year. The top 200 cutsets from this quantification output file are shown in Table 54B-3. The associated component importance file is shown in Table 54B-4.

54B.2.2 Case 2 Sensitivity Study - Effect on Focused PRA (Surge Line) Results

The Case 2 sensitivity study estimates the effect of the design changes on the focused PRA sensitivity study core damage frequency of $5.1E-07$, discussed above in subsection 54B.1.2.

This estimation is conducted by making changes to the basic events in quantification output file from the surge line Level 1 focused PRA case. The following steps were done:

- a) Revise basic event probabilities associated with the new IRWST configuration and unscheduled maintenance unavailability discussed in subsection 54A.1; IWX-MV-GO1 is set to 2.6E-05, IWX-CV-AO set to 3.0E-05, IRWMOD05S set to 3.0E-03, and IRWMOD06S set to 0.
- b) Revise the basic event frequencies for CCS initiating events to reflect the changes discussed in subsection 54A.4; IEV-CCWD is set to 6.02E-04, and IEV-CCWND set to 3.75E-03.

Note, the service water system basin capacity design change is not included in the focused PRA sensitivity study because this failure does not affect the SWS-related initiating events, and the focused PRA does not credit nonsafety-related systems in the event trees.

Having modified the basic events to incorporate these design changes into the shutdown PRA, the focused PRA quantification output file is recalculated to estimate the shutdown core damage frequency. The resulting shutdown core damage frequency changes from 5.1E-07 events per year to 4.8E-07 events per year. The top 200 cutsets from this quantification output file are shown in Table 54B-5. The associated component importance file is shown in Table 54B-6.

54B.2.3 Case 3 Sensitivity Study - Single IRWST Train & 2 ADS 4th Stage Operation

AP600 Technical Specifications 3.5.8 and 3.4.14 allow one of the IRWST injection trains and two ADS 4th stage valves to be out of service during reduced inventory conditions. These technical specification provisions are to allow for unscheduled repairs of components in any one of the IRWST injection trains and any two ADS 4th stage valves during drained conditions. These provisions are not intended to allow plant personnel to schedule or plan maintenance activities to be conducted during reduced inventory conditions, and, therefore, should not be misconstrued as such.

However, a sensitivity study is performed to estimate the core damage frequency if one train of IRWST and two ADS 4th stage valves are failed at the same time. For this conservative estimate of the design configuration, one IRWST train and two ADS 4th stage valves are assumed to fail during filled and drained shutdown conditions. That is, it is assumed that (a) the IRWST has only one injection line by essentially setting the other train failure probability equal to 1.0; and (b) the ADS 4th stage has only two valves by propagating the common cause failure of two 4th stage valves through the shutdown model.

Note, the ADS 4th stage operation with only 2 valves is reflected in the model by changing only the common cause of the 4 ADS 4th stage squib valves to common cause of 2 ADS 4th stage squib valves. Changes to the squib valves random failure probabilities were not attempted since these changes would not change the result of this sensitivity study.

This sensitivity is performed by modifying basic events in the quantification output file from Case 1, discussed above in subsection 54B.2.1. The following basic events are modified as shown:

ADX-EV-SA = 3.8E-05; IWACV122AO = 1.0; IWACV123AO = 5.8E-04; IWACV124AO = 1.0; IWACV125AO = 5.8E-04; IWBCV122AO = 1.75E-03; IWBCV123AO = 5.8E-04; IWBCV124AO = 1.75E-03; IWBCV125AO = 5.8E-04; IWX-CV-AO = 3.1E-05; IWX-MV-

GO1 = 3.8E-05; IRWMOD05S = 0; IRWMOD06S = 0; RNSMOD05S = 1

Requantification of the cutset file with these changes provides a core damage frequency of 1.2E-06 events per year. However, a core damage frequency of 1.2E-06 is still quite low. The top 200 cutsets from this quantification output file is shown in Table 54B-7. The associated component importance file is shown in Table 54B-8.

This estimate of the core damage frequency at shutdown is believed to be conservative for the following reasons:

- One train of IRWST is assumed to fail during both drained and non-drained conditions
- Two ADS 4th stage valves are assumed to fail during both drained and non-drained conditions
- The IRWST water is considered to be clean water, suitable for injection into the RCS
- The IRWST is covered to preclude material that could clog the strainer from entering the tank
- The IRWST strainer is assigned a conservative failure probability of 2.4E-04 in the PRA. The plugging of the IRWST strainer is expected to be a much less probable event than reflected in a failure probability of 2.4E-04.

54B.2.4 Case 4 Sensitivity Study - Setting HEPs to 0.5 in Case 1 Cutsets

The Case 4 sensitivity study estimates the effect of the setting the human error probabilities to 0.5 in the quantification output file from Case 1, discussed above in subsection 54B.2.1. The following basic events are set to 0.5:

ADN-MAN01, CCB-MAN01, IWN-MAN01, IWN-MAN01C, LPM-MAN05, REC-MANDAS, REC-MANDASC, RHN-MAN03, RHN-MAN04, RHN-MAN04-SUCC; RHN-MAN05, RHN-MAN05C, PRN-MAN01, SWB-MAN02, and ZON-MAN01.

Requantification of the cutset file with these changes provides a core damage frequency of 2.4E-06 events per year. However, a core damage frequency of 2.4E-06 is still quite low. The top 200 cutsets from this quantification output file is shown in Table 54B-9. The associated component importance file is shown in Table 54B-10.

54B.2.5 Case 5 Sensitivity Study - Setting HEPs to 0.5 in Case 3 Cutsets

The Case 5 sensitivity study estimates the effect of the setting the human error probabilities to 0.5 in the quantification output file from Case 3, discussed above in subsection 54B.2.3. The following basic events are set to 0.5:

ADN-MAN01, CCB-MAN01, IWN-MAN01, IWN-MAN01C, LPM-MAN05, REC-MANDAS, REC-MANDASC, RHN-MAN03, RHN-MAN04, RHN-MAN04-SUCC; RHN-MAN05, RHN-MAN05C, PRN-MAN01, SWB-MAN02, and ZON-MAN01.

Requantification of the cutset file with these changes provides a core damage frequency of 6.2E-

06 events per year. However, a core damage frequency of $6.2E-06$ is still quite low. The top 200 cutsets from this quantification output file is shown in Table 54B-11. The associated component importance file is shown in Table 54B-12.

54B.3 Conclusion

The design changes were evaluated to determine their effect on the PRA results and insights from the surge line sensitivity study. The previous subsections provide details on the five quantitative sensitivity studies that basically assess the effects of these design changes on the shutdown (surge line) baseline and focused PRA core damage frequencies. The results of this evaluation are as follows:

- a) When the design changes are incorporated together, the baseline (surge line) shutdown PRA core damage frequency changes from $6.7E-08$ to $7.0E-08$ events per year; an increase of only 4 percent.
- b) When the design changes are incorporated together, the focused (surge line) shutdown PRA core damage frequency changes from $5.1E-07$ to $4.8E-07$ events per year; a decrease of 6 percent.
- c) Although some top cutsets are reordered, the top 50 to 100 cutsets are more or less the same. This can be seen when the cutsets for the baseline and focused shutdown studies in Section 54B.1 are compared with the results from Cases 1 and 2 in Section 54B.2.
- d) Although basic events importance are changed and reordered in some cases, the most important events are relatively the same, as shown by their "importance % decrease" values in the related component importance tables.
- e) When the HEPs are set to 0.5 in the surge line baseline case, the core damage frequency becomes $2.4E-06$ events per year, which is about 34 times greater than the base case core damage frequency of $7.0E-08$ events per year. This increase in the base case core damage frequency is somewhat significant even though a core damage frequency of $2.4E-06$ is still quite low. The result indicates that the operator actions are important in maintaining a very low core damage frequency for internal events at shutdown.
- f) Although the functions of the IRWST and the RNS and its support systems (CCS and SWS) are still important to maintaining plant safety during shutdown, the function of ADS becomes more important than reflected in Revision 6 of the PRA, since the ADS 4th stage is now required to preclude the effects of surge line flooding and thereby maintain plant safety. The importance of these functions are due mainly because of their required operability during reduced inventory conditions, where initiating events dominate the plant shutdown risk.

REVISION TO PRA PAGE 54A-6

This sensitivity is performed by modifying the following basic events in the quantification output file:

IWACV122AO = 1.0; IWACV123AO = 5.8E-04; IWACV124AO = 1.0;
IWACV125AO = 5.8E-04; IWBCV122AO = 1.75E-03; IWBCV123AO = 5.8E-04;
IWBCV124AO = 1.75E-03; IWBCV125AO = 5.8E-04; IWX-CV-AO = ~~5.4E-07~~ 3.1E-05; IWX-MV-GO1 = ~~4.0E-05~~ 3.8E-05; IRWMOD05S = 0; and IRWMOD06S = 0.

Requantification of the cutset file with these changes provides a core damage frequency of ~~4.8E-07~~ 2.0E-07 events per year. Since this evaluation is a sensitivity study of the main exercise in assessing the reliability of the new IRWST design, the output file for this case is not included in this report.

This estimate of the core damage frequency at shutdown is believed to be conservative for the following reasons:

- One train of the IRWST is assumed to fail during both drained and non-drained conditions.
- Approximately ~~67~~ 61 percent of the core damage frequency of ~~4.8E-07~~ 2.0E-07 events per year is attributed to dominant failures that include failure of the IRWST injection line strainer; (i.e., the top two cutsets total 1.2E-07, and these cutsets include basic event IWB-PLUG).
- The IRWST water is considered to be clean water, suitable for injection into the RCS.
- The IRWST is covered to preclude material that could clog the strainer from entering the tank.
- The IRWST strainer is assigned a conservative failure probability of 2.4E-04 in Revision 6 of the PRA. The plugging of the IRWST strainer is expected to be a much less probable event than reflected in a failure probability of 2.4E-04.

Therefore, failure of the IRWST line strainer is more dominant than would be expected for failure of a strainer in a clean water system. If a more realistic failure probability is used for strainer plugging, the resulting core damage frequency of the model having a single IRWST train configuration should be much closer to the core damage frequency of 5.5E-08 events per year. This is obtained from the baseline shutdown model of PRA, Revision 6.

54A.2 IRWST Recirculation Paths Changed from 10-inch and 4-inch Lines to 6-inch Lines

This design change has no impact on the shutdown core damage frequency calculation, since the recirculation function is not credited in the Level 1 shutdown PRA. (See note in Section 54A.3 below).
