# U.S. Bureau of the Census User Questionnaire

Dear user:

In an effort to improve the quality of this report, the following questionnaire has been included for your comments so we may direct our efforts to providing the information most needed by you, the user. Please take a few moments to fill out this form, fold A to A and fold B to B, then tape and drop it in the mail, postage paid. Thank you for your suggestions and cooperation.

**Current Population Reports, P-60, No. 180, "Money Income of Households, Families, and Persons in the U.S.: 1991"**

**1. What is your organizational affiliation?**

- Federal Government
- State/local government
- Educational institution *Mark (X) one*
  - Student
  - Faculty
  - Administration
- Private organization *Mark (X) one*
  - Media/information service
  - Trade association
  - Marketing research
  - Other - *Please specify*
  - Legal firm
  - Professional association
  - Research institution

(A) Fold here first

(V)

**2. Are you a frequent user of reports issued in this series?**

- First time user
- Infrequent
- Frequent/routine user

**3. Are you a user of similar data from:**

*Mark (X) all that apply.*

- Other Census Bureau reports
- Reports issued by other government agencies - *Please specify organization and report title*
- Reports issued by private, nongovernmental organizations *Please specify organization and report title*

**4. The following asks two questions about specific sections of the report.**

**Was the section useful to you? (Did it contain information you were looking for?)**

**Was the section easy to understand and use?**

*Please answer each question using the scale provided. Four (4) indicates useful or easy to understand, one (1) indicates not useful or hard to understand.*

Fold here

## DETAILED TABLES

### Households

1.	Median Income of Households, by Selected Characteristics, Race, and Hispanic Origin of Householder: 1991, 1990, and 1989.....	1
2.	Selected Characteristics of Households—Households, by Total Money Income in 1991.....	5
3.	Percent Distribution of Households, by Selected Characteristics Within Income Quintile and Top 5 Percent in 1991.....	7
4.	Percent Distribution of Households, by Income Quintile and Top 5 Percent for Selected Characteristics in 1991.....	8
5.	Type of Residence—Households, by Total Money Income in 1991, Race, and Hispanic Origin of Householder.....	9
6.	Type of Household—Households, by Total Money Income in 1991, Race, and Hispanic Origin of Householder.....	11
7.	Regions and Divisions—Households, by Total Money Income in 1991.....	13
8.	Age of Householder—Households, by Total Money Income in 1991, Type of Household, Race, and Hispanic Origin of Householder.....	14
9.	Size of Household—Households, by Total Money Income in 1991, Race, and Hispanic Origin of Householder.....	28
10.	Number of Earners—Households, by Total Money Income in 1991, Race, and Hispanic Origin of Householder.....	30
11.	Persons in Households, by Total Household Income in 1991, Relationship to Householder, Age, Sex, Race, and Hispanic Origin.....	32
12.	Presence of Elderly—Households, by Total Money Income in 1991, Race, and Hispanic Origin of Householder.....	38

### Families

13.	Median Income of Families, by Selected Characteristics, Race, and Hispanic Origin of Householder: 1991, 1990, and 1989.....	40
14.	Selected Characteristics of Families—Families, by Total Money Income in 1991.....	44
15.	Percent Distribution of Families, by Selected Characteristics Within Income Quintile and Top 5 Percent in 1991.....	46
16.	Percent Distribution of Families, by Income Quintile and Top 5 Percent for Selected Characteristics in 1991.....	48
17.	Age of Householder—Families, by Total Money Income in 1991, Type of Family, Race, and Hispanic Origin of Householder.....	50
18.	Presence of Related Children Under 18 Years Old—Families, by Total Money Income in 1991, Type of Family, Race, and Hispanic Origin of Householder.....	68
19.	Presence of Related Children Under 18 Years Old—Married-Couple Families, by Total Money Income in 1991 and Work Experience in 1991 of Husband and Wife..	77
20.	Size of Family—Families, by Total Money Income in 1991, Race, and Hispanic Origin of Householder.....	84
21.	Number of Earners—Families, by Total Money Income in 1991, Race, and Hispanic Origin of Householder.....	86

22.	Source of Income—Families, by Total Money Income in 1991, Race, and Hispanic Origin of Householder .....	88
23.	Selected Characteristics of Unrelated Individuals—Unrelated Individuals 15 Years Old and Over, by Total Money Income in 1991 .....	91

### Persons

24.	Median Income of Persons, by Selected Characteristics: 1991, 1990, and 1989.....	92
25.	Selected Characteristics of Persons—Persons 15 Years Old and Over, by Total Money Income in 1991, Work Experience in 1991, and Sex .....	96
26.	Age—Persons 15 Years Old and Over, by Total Money Income in 1991, Race, Hispanic Origin, Sex, and Work Experience in 1991 .....	100
27.	Relationship—Persons 15 Years Old and Over, by Total Money Income in 1991, Race, Hispanic Origin, Sex, and Work Experience in 1991 .....	108
28.	Marital Status—Persons 18 Years Old and Over, by Total Money Income in 1991, Race, Hispanic Origin, Sex, and Work Experience in 1991 .....	112
29.	Educational Attainment—Persons 25 Years Old and Over, by Total Money Earnings in 1991, Age, Race, Hispanic Origin, Sex, and Work Experience in 1991 .....	116
30.	Educational Attainment—Persons 18 Years Old and Over, by Total Money Earnings in 1991, Age, Work Experience in 1991, and Sex .....	144
31.	Work Experience in 1991—Persons 15 Years Old and Over, by Total Money Earnings in 1991, Race, Hispanic Origin, and Sex .....	148
32.	Occupation of Longest Job in 1991—Persons 15 Years Old and Over, by Total Money Earnings in 1991, Work Experience in 1991, and Sex .....	152
33.	Occupation of Longest Job by Industry of Longest Job in 1991—Persons 15 Years Old and Over, by Total Money Earning in 1991, Work Experience in 1991, and Sex .....	158
34.	Source of Income in 1991—Number With Income and Mean Income of Specified Type in 1991 of Persons 15 Years Old and Over, by Age .....	174

### APPENDIXES

A.	Bureau of Labor Statistics' Statement on the Use of the CPI-U X1 .....	A-1
B.	Time Series Estimates of Income (Using the CPI-U-X1 Price Deflators) and State Income Data .....	B-1
C.	Definitions, Explanations, and Comparability of Data .....	C-1
	Definitions and Explanations .....	C-1
	Comparability of Current Population Survey Income Data With Other Data .....	C-7
	Comparability of Current CPS Estimates With Those From Previous Years .....	C-9
	Revisions to the March 1989 CPS Processing System .....	C-11
	Quality of Income Data .....	C-13
D.	Source and Accuracy of Estimates .....	D-1
	Source of Data .....	D-1
	Accuracy of Estimates .....	D-2
E.	Facsimiles of March 1992 CPS Questionnaires .....	E-1
	Facsimile I. Control Card .....	E-1

# Money Income of Households, Families, and Persons In the United States: 1991

**NOTE:** Beginning with this report, the experimental Consumer Price Index (CPI-U-X1) will be used in the P-60 Consumer Income reports as a deflator in making historical comparisons involving income data. In the past, the CPI-U index was primarily used in making income comparisons over time. (See Appendix A, "Bureau of Labor Statistics' Statement on the Use of the CPI-U-X1," and the Current Population Report, P-60, No. 174, *Money Income of Households, Families, and Persons in the United States: 1990*, for a discussion of the uses of the CPI-U-X1 and CPI-U as price deflators.)

In January 1992, a new educational attainment question comparable to that used in the 1990 census of population was introduced in the Current Population Survey (CPS). Consequently, data on educational attainment from the 1992 CPS are not directly comparable to CPS data for prior years. A discussion of the change in the educational attainment item can be found in the descriptive text of this report.

The estimates for March 1990, 1991, and 1992 in this report are inflated to national population controls by age, race, sex, and Hispanic origin. The population controls are based on results of the 1980 census carried forward to 1990, 1991, and 1992. The estimates in this report, therefore, may differ from estimates that would have been obtained using 1990 census results brought forward to the survey date. Population controls incorporating 1990 census results will be used for survey estimation beginning in 1993.

## INTRODUCTION

This report presents data on the income of households, families, and persons in the United States for the calendar year 1991. These data were compiled from information collected in the March 1992 Current Population Survey (CPS) conducted by the Bureau of the Census. The survey consisted of approximately 60,000 households nationwide.

The official income estimates in this report are based solely on money income before taxes and do not include the value of noncash benefits such as food stamps, Medicare, Medicaid, public housing, and employer-provided fringe benefits. For a discussion of the effects of taxes and noncash benefits on income in 1991, see Current Population Reports, Series P-60, No. 182-RD, *Measuring the Effect of Benefits and Taxes on Income and Poverty: 1979 to 1991*.

This report begins with a section on household income, with year-to-year comparisons by region, age of householder, type of residence, race and Hispanic origin, and type of household. This is followed by sections on changes in family income by type of residence, family composition, race and Hispanic origin, and size of family. Sections on the income of year-round, full-time workers, per capita income, income inequality, and State income data follow the family section.

A section on health insurance coverage is included in this report for the first time. This section discusses health insurance coverage of persons by type of coverage and the variation in health insurance coverage by State.

The CPS is a cross-sectional survey which can provide a series of snapshots of the socioeconomic conditions that exist at different fixed points in time. To demonstrate the extent to which individuals and population subgroups experience year-to-year changes in economic well-being, information from the Survey of Income and Program Participation (SIPP) is also included in this report. See the section entitled "Distribution of Income-to-Poverty Ratios."

## HIGHLIGHTS

(The figures in parentheses denote the 90-percent confidence intervals.)

- Beginning in July of 1990, the United States entered into its most recent recessionary period. Between 1990 and 1991, real median household income declined by 3.5 ( $\pm 0.9$ ) percent, from \$31,203 ( $\pm \$262$ ) to \$30,126 ( $\pm \$237$ ).<sup>1</sup> Real median household income has declined by a total of 5.1 ( $\pm 1.1$ ) percent between 1989 and 1991.
- Declines in real median household income between 1990 and 1991 occurred in all regions except the Northeast. Real median household income declined

<sup>1</sup>Changes in real income refer to comparisons after adjusting for inflation. The percentage changes in prices between earlier years data and 1991 were computed by dividing the annual average Consumer Price Index (CPI) for 1991 by the annual average for earlier years. See table B-1 in appendix B for the CPI's from 1947 to 1991.

by 3.9 (±1.8) percent in the Midwest to \$29,927 (±\$490), by 3.2 (±1.5) percent in the South to \$27,178 (±\$352), and by 2.6 (±1.7) percent in the West to \$32,253 (±\$505).<sup>2</sup> The Northeast region, with a median of \$33,467 (±\$635), showed no statistically significant change. All regions experienced significant declines between 1989 and 1991.

- For the second consecutive year, the median income of households inside metropolitan areas experienced a decline in real income, while the median income of households outside metropolitan areas showed no significant change. The real median income of households inside metropolitan areas declined by 3.6 (±0.9) percent from \$33,162 (±\$263) to \$31,975 (± \$270) between 1990 and 1991. The median income of households outside metropolitan areas was \$24,691 (±\$541).
- The change in real median household income between 1990 and 1991 was not consistent across the race and ethnic origin groups. The real median income of White and Asian and Pacific Islander households declined 3.0 (±0.9) percent and 9.0 (±5.3) percent, respectively. The median income of Black households and households maintained by a person of Hispanic origin showed no significant change between 1990 and 1991.
- Families maintained by women with no spouse present experienced declines in real median family income between 1990 and 1991 much higher than the decline experienced by married-couple families. The median income of married-couple families declined by 1.4 (±0.9) percent to \$40,995 (±\$336). The median income of families maintained by women with no husband present declined by 5.4 (±2.7) percent to \$16,692 (±\$429).
- The real median earnings of male year-round, full-time workers increased by 2.0 (±1.5) percent between 1990 and 1991 to \$29,421 (±\$364). The median earnings of their female counterparts remained unchanged at \$20,553 (±\$160). The increase in the median earnings of males and the unchanged earnings of females lowered the female-to-male earnings ratio to .70 (±0.01), down from the all-time high of .72 (±0.01) reached in 1990.<sup>3</sup>
- The decline in per capita income continued for the second consecutive year. Per capita income declined by a total of 5.3 (±1.1) percent in real terms between 1989 and 1991; between 1990 and 1991, per capita

income declined 2.5 (±1.0) percent to \$14,617 (±\$123). Prior to 1990, real per capita income had increased for 7 consecutive years (from 1983 to 1989).

- Comparing median household income among the States using a 3-year average (1989-1991) shows that Mississippi had the lowest median income in the Nation. At the other end of the scale, the median household income of Connecticut, although not statistically different from that of New Jersey and Alaska, was higher than the incomes of the remaining 47 States and the District of Columbia.
- The percent of persons without health insurance coverage in 1991 was 14.1 (±0.3) percent, unchanged from 1990.

### HOUSEHOLD INCOME

For the second consecutive year, households in the United States experienced a significant decline in real income. Median household income declined by 3.5 percent between 1990 and 1991 from \$31,203 to \$30,126. (See table A.) Over the past 2 years, real median household income has declined by a total of 5.1 percent. This decline in income is the effect of the most recent recessionary period which began in July of 1990.

The decline in real median household income between 1989 and 1991 (5.1 percent) was not statistically different from the decline which occurred for the recessionary period spanning from November 1973 to March 1975 (5.7 percent). (See chart below which specifies income years used in calculating percent changes.) However, the current decline in household income is significantly larger than those which occurred for the recessionary periods spanning from December 1969 to November 1970, (a decline of 1.6 percent) and the combined recessionary periods of January 1980 to July 1980 and July 1981 to November 1982 (a decline of 1.9 percent).<sup>4</sup>

Selected recessionary periods	Income years	Percent decline in real income <sup>1</sup>
July 1990 to .....	1989 to 1991	5.1
January 1980 to July 1980 and July 1981 to November 1982 ..	1980 to 1982	1.9
November 1973 to March 1975 .	1973 to 1975	5.7
December 1969 to November 1970.....	1969 to 1971	1.6

<sup>1</sup>Median household income adjusted to 1991 dollars using the CPI-U-X1 price deflator.

**Region.** Declines in real median household income between 1990 and 1991 occurred in all regions except the Northeast. (See table A.) Real median household

<sup>4</sup>There was no statistically significant difference between the decline in household income for the December 1969 to November 1970 period and the January 1980 to November 1982 period.

<sup>2</sup>There is no statistically significant difference between the declines for the Midwest, South, and West regions.

<sup>3</sup>The earnings data and female-to-male earnings ratios for 1989 and 1990 were modified based on the inclusion of data on members of the Armed Forces.

Table A. Comparison of Income Summary Measures by Selected Characteristics: 1989 to 1991

(Households, families, and persons as of March 1992)

Characteristic	1991		Median income (in 1991 dollars)		Percent change in real income

\*Statistically significant change at the 90-percent confidence level.

<sup>1</sup>Persons of Hispanic origin may be of any race.

income declined by 3.9 percent in the Midwest to \$29,927, by 3.2 percent in the South to \$27,178, and by 2.6 percent in the West to \$32,253.<sup>5</sup> The Northeast region, with a median of \$33,467, showed no statistically significant change. All regions experienced a significant decline in real income between 1989 and 1991.

**Age of householder.** Change in median household income between 1990 and 1991 varied by the age of the householder. The real median income of households with householders 15 to 24, 45 to 54, 55 to 64, and 75 years old and over remained unchanged between 1990 and 1991. Significant declines in real median income, however, were experienced by households with householders 25 to 34 years old, 35 to 44 years old, and 65 to 74 years old. These households experienced declines of 2.5 percent, 2.1 percent, and 5.1 percent, respectively.<sup>6</sup> (See table 1.) This was the second consecutive year households with householders 25 to 34 years old experienced declines in real income and the third consecutive year for households with householders 35 to 44 years of age.

**Type of residence.** For the second consecutive year, the median income of households inside metropolitan areas experienced a decline in real income, while the median income of households outside metropolitan areas showed no significant change. The real median income of households inside metropolitan areas declined by 3.6 percent, from \$33,162 to \$31,975, between 1990 and 1991. The median income of households outside metropolitan areas was \$24,691. (See tables A and 1.)

**Race and Hispanic origin.** The change in real median household income was not consistent across race and ethnic origin groups. The real median income of White households declined by 3.0 percent between 1990 and 1991 to a level of \$31,569. This was the second consecutive year White households have experienced declines in their median income. The real median income of Asian and Pacific Islander households declined by 9.0 percent to \$36,449.<sup>7</sup> The median income of Black

households (\$18,807) and of Hispanic origin households (\$22,691) showed no significant change between 1990 and 1991. (See table A.) Since 1989, the real median household income for Whites declined by 5.5 percent; for Asian and Pacific Islanders, 8.1 percent; for Blacks, 5.3 percent; and for Hispanics 5.8 percent.<sup>8</sup> (See figure 1.)

Change in median household income varied by race and origin group within the regions. Similar to the total population, White households experienced declines in real median household income in all regions except the Northeast. The only region in which Black households showed a significant change was the South, where household income declined 6.3 percent, in real terms, to a level of \$17,247. About 54 percent of all Black households reside in the South. The median income of Hispanic origin households showed no statistically significant change in any of the four regions. (See table 1.)

**Type of household.** Declines in real median income between 1990 and 1991 were experienced by both family and nonfamily households. The median income of family households declined by 2.2 percent and that of nonfamily households by 3.6 percent.<sup>9</sup> The median income of family households in 1991 was \$36,404, more than twice as high as the median income of nonfamily households, \$17,774. (See table 1.)

## FAMILY INCOME

Overall, median family income declined by 2.4 percent in real terms to \$35,939 in 1991.<sup>10</sup> (See table A.) Since 1989, real median family income has declined by 4.4 percent. As with households, changes in family income were not consistent by race and ethnic origin group. Between 1990 and 1991, White families experienced a 1.8 percent decline in real median income to \$37,783, while the median income for Black and Hispanic origin families remained unchanged (\$21,548 and \$23,895, respectively).

**Type of residence.** Families living in metropolitan areas, regardless of the size of the metropolitan area, did not fare as well between 1990 and 1991 as families living outside metropolitan areas. Families living inside metropolitan areas experienced a 2.8 percent decline in real median income to \$38,370. The median income of families living outside metropolitan areas remained unchanged at \$29,127. (See table 13.)

<sup>5</sup>There is no statistically significant difference between the declines for the Midwest, South, and West regions.

<sup>6</sup>There was no statistically significant difference between the declines in household income for households with householders 25 to 34 years old and those households with householders 35 to 44 years old and 65 to 74 years old.

<sup>7</sup>The Asian and Pacific Islander population, like the Hispanic population, is comprised of many distinct groups who differ in socioeconomic characteristics, culture, and recency of immigration. Since there are differences among the individual groups, caution should be exercised when interpreting aggregate data for these population groups. In addition, income data from the CPS for the Asian and Pacific Islander population is currently limited. Income data in this report for this population group is limited to a discussion of the change in median household income. Generalized references regarding differences among race groups in the remainder of the report should not be interpreted as referring to the Asian and Pacific Islander population.

<sup>8</sup>There is no significant difference between the declines in income between 1989 and 1991 of White, Asian and Pacific Islander, Black, and Hispanic-origin households.

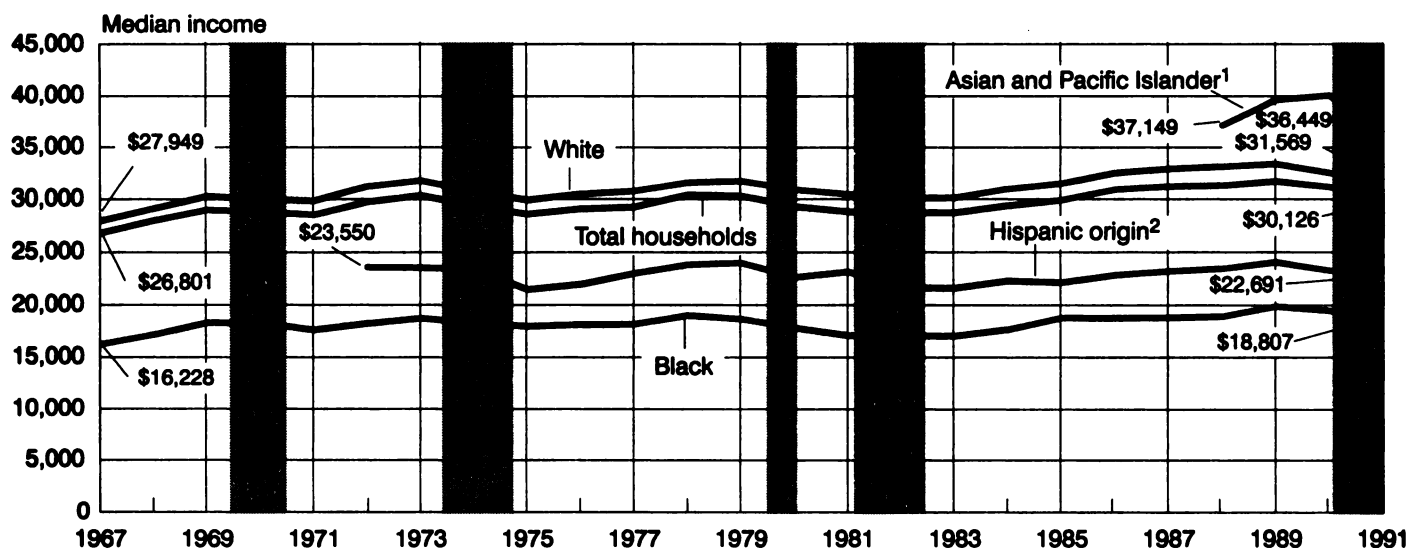

<sup>9</sup>There is no statistically significant difference between the declines in income of family households and nonfamily households.

<sup>10</sup>Family income differs from family household income because family household income not only includes the income of family members but the income of nonrelatives living in the household as well.

Figure 1.  
**Median Household Money Income, by Race and Hispanic Origin: 1967–1991**

(In 1991 CPI-U-X1 Dollars)

Shaded areas = Recessionary periods. The latest recessionary period began in July of 1990.

NOTE: The data points represent the midpoints of the respective years.

<sup>1</sup> Median income of Asian and Pacific Islander households is not available prior to 1988.

<sup>2</sup> Persons of Hispanic origin may be of any race. Median income of Hispanic-origin households is not available prior to 1972.

Although families living outside metropolitan areas fared better between 1990 and 1991, their median income remained the lowest among families by type of residence. On the other hand, families living in the suburbs of large metropolitan areas (metropolitan areas of one million or more persons), continue to have the highest median income, \$46,061.

**Family composition, race, and Hispanic origin.** Declines in real median income were experienced by all families regardless of type, however, some types of families fared better than others. The median income of married-couple families declined by 1.4 percent to \$40,995. Families maintained by men and women with no spouse present experienced declines much higher than the decline experienced by married-couple families. The median income of families maintained by men with no wife present declined by 6.3 percent to \$28,351. Families maintained by women with no husband present experienced a 5.4 percent decline.<sup>11</sup> The median income of families with a female householder, no husband present was \$16,692 in 1991, less than half the median of married-couple families. (See tables A and 13.)

Change between 1990 and 1991 in real median family income for married-couple families varied by race

and origin group. The median income of Black married-couple families declined by 5.4 percent, compared with a 1.2 percent decline for White married-couple families. The median income of Hispanic origin married-couple families remained unchanged. Although Black married-couple families experienced a larger decline in median income relative to White married-couple families, the Black-to-White income ratio for married-couple families (.80) did not change significantly between 1990 and 1991. The Hispanic origin-to-White income ratio for married-couple families also remained unchanged at .69.

**Size of family.** Decreases in real median family income between 1990 and 1991 were experienced by small families and large families. (See table 13.) The median income of families containing three, four, and five persons remained unchanged; families containing two, six, and seven or more persons experienced declines of 4.8 percent, 8.1 percent, and 9.9 percent, respectively.<sup>12</sup>

## YEAR-ROUND, FULL-TIME WORKERS

The real median earnings of male year-round, full-time workers with earnings increased by 2.0 percent between 1990 and 1991 to \$29,421. The median earnings of their female counterparts remained unchanged

<sup>11</sup>There is no statistically significant difference between the declines for families maintained by men with no wife present and women with no husband present.

<sup>12</sup>There is no significant difference between the declines in median income of two-, six-, and seven-or-more-person families.

at \$20,553. (See tables A and 24.) The increase in the median earnings of males and the unchanged earnings of females lowered the female-to-male earnings ratio to .70, down from the all-time high of .72 reached in 1990.<sup>13</sup>

The increase in the median earnings of male year-round, full-time workers with earnings occurred while the total number of male year-round, full-time workers with earnings decreased considerably. (See table 24.) Since 1989, the number of male year-round, full-time workers has declined by 1.8 million. Between 1990 and 1991, the decline was 1.3 million.<sup>14</sup> The 1990-1991 decline was most notable in the number of male year-round, full-time workers with relative low earnings. In fact, the number of male year-round, full-time workers with earnings below the inflation adjusted 1990 median, \$28,843, declined by 1.1 million; the number of workers with earnings above \$28,843 remained statistically unchanged. This compositional change resulted in the higher median earnings of male year-round, full-time workers. In addition, about 46 percent of the 1.3 million decline in male year-round, full-time workers with earnings occurred in the precision, production, craft, and repair occupation group.

**Educational attainment.** The educational attainment item used in the March 1992 CPS questionnaire differs from that used in past years. See the section entitled "Changes in the Educational Attainment Item," for an explanation of the change and a brief discussion of the form of the new question.

The relationship between educational attainment and median income of year-round, full-time workers 25 years old and over is strong. Data in table 24 show that the median income of persons increases sharply as educational attainment increases. This relationship exists for both men and women. For men, the 1991 median income of high school graduates was \$26,779; for those attaining an Associate's degree the median income was \$33,817. For men with a Bachelor's degree or a post-graduate degree such as a Master's, the median incomes were \$40,906 and \$49,734, respectively. Although the same pattern is evident for women, their median incomes were much lower than that for men at every educational attainment level. Women who were high school graduates had a median income of \$18,837; those attaining an Associate's degree, \$25,002; those with a Bachelor's degree, \$29,087; and those attaining a Master's degree \$34,939.

<sup>13</sup>The earnings data and female-to-male earnings ratios for 1989 and 1990 were modified based on the inclusion of data on members of the Armed Forces.

<sup>14</sup>There is no statistically significant difference between the 1989-1991 and 1990-1991 declines in the number of male year-round, full-time workers with earnings.

## PER CAPITA INCOME

The decline in per capita income continued for the second consecutive year. Per capita income declined by 5.3 percent in real terms between 1989 and 1991; between 1990 and 1991, per capita income declined 2.5 percent to \$14,617. Prior to 1990, real per capita income had increased in 7 consecutive years (from 1983 to 1989). The per capita income of Blacks and Hispanics did not change significantly between 1990 and 1991, however, the per capita income of Whites declined by 2.5 percent in real terms to \$15,510. In 1991, the per capita incomes of Blacks and Hispanics were \$9,170 and \$8,662, respectively, considerably lower than that of the White population. (See tables A and B-19.)

## INCOME INEQUALITY

Several methods are used to measure income inequality. Traditionally, the Census Bureau has used two of the more common methods: the shares of aggregate income received by households (or other income reciprocity units) and the Gini index (or index of income concentration).<sup>15</sup> In the shares approach, households or families are ranked from lowest to highest on the basis of income and then divided into equal population groups, typically quartiles, quintiles, or deciles. The aggregate income of each group is then divided by the overall aggregate income to derive shares. The Gini index, which is related to the shares approach, summarizes in a single statistic the dispersion of the income shares across the whole income distribution. The Gini index ranges from 0, indicating perfect equality (where everyone receives an equal share), to 1, perfect inequality (where all the income is received by only one recipient).

Between 1990 and 1991, both measures indicated that the amount of inequality in the income distributions of households and families was unchanged. (See tables B-3 and B-7.) In 1991, the Gini index for households was .428, for families it was .397, neither statistically different from the Gini indexes for 1990. (The Gini index for households is higher than for families since the former contain unrelated individuals living alone or with other unrelated individuals who have low incomes, thereby causing more dispersion of income.)

Income inequality, however, has risen substantially over the long run. As shown in figure 2, the Gini index for both households and families rose slowly during the 1970's, and then accelerated in the 1980's. The shares

<sup>15</sup>A new measure of income dispersion called relative income, recently introduced by the Census Bureau, was designed to measure how far the income of an individual is from the middle of the distribution after adjustments have been made for differences in family size. See John McNeil, *Trends in Relative Income: 1964 to 1989*, U.S. Bureau of the Census, Current Population Reports, Series P-60, No. 177, U.S. Government Printing Office, Washington, D.C., 1991.

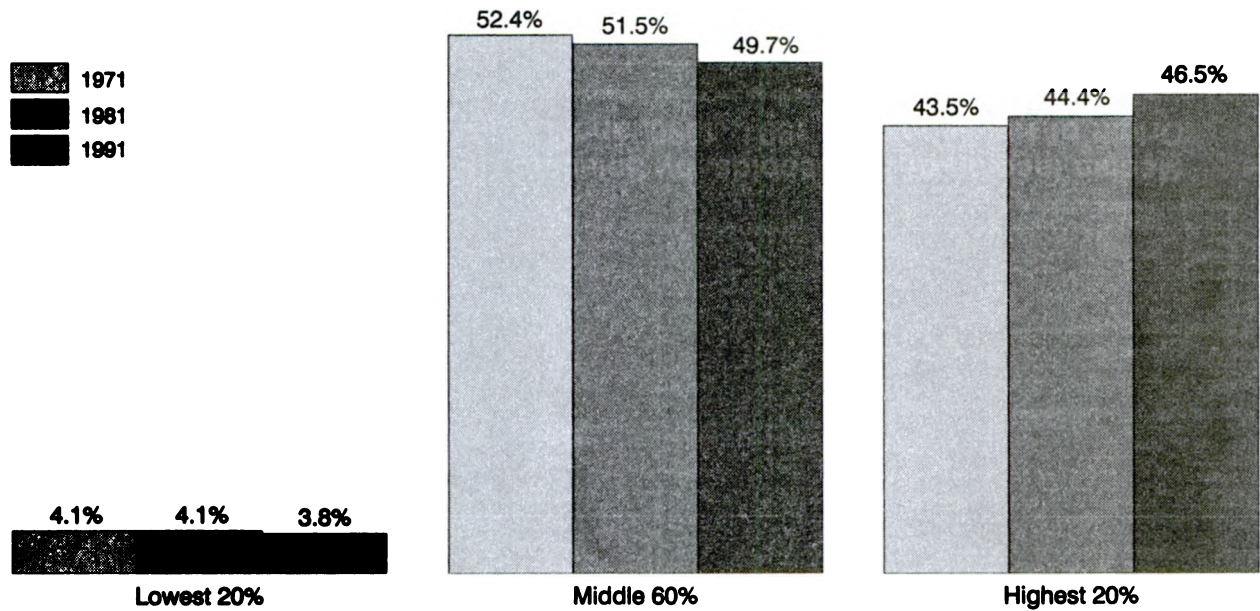

**Figure 2.**  
**Percent Change in Household and Family Gini Indexes: 1967–1991**

Shaded areas = Recessionary periods. The latest recessionary period began in July of 1990.  
 NOTE: The data points represent the midpoints of the respective years.

**Figure 3.**  
**Share of Aggregate Household Income, by Quintile: 1971, 1981, and 1991**

(Percent share)

of aggregate income received by the highest fifth of households and families increased sharply during these years, reflecting the faster growth of incomes at the upper end of the income distribution relative to the other fifths. (See Figure 3.)<sup>16</sup>

The cause of growing income inequality over this period has been the subject of much attention in the research community. Because earnings from the labor market usually represent the most important source of income in the average household or family, researchers have focused on changes taking place in the Nation's labor market and wage distribution. And indeed, a number of them have found that inequality in the distribution of wages and earnings has increased in recent years and that this has been a key factor in the trend in overall income inequality.<sup>17</sup>

Various explanations have evolved concerning the growing inequality of wages and earnings. Briefly noted below are some of the explanations for rising wage and earnings inequality, which are discussed in the forthcoming September 1992 issue of the *Journal of Economic Literature*.<sup>18</sup>

One of the first involves the industrial restructuring of the economy from goods-production to services-production. Industries involved in the latter typically pay lower wages and have greater variation in their wage structures.

Another explanation focuses on the growing gap in the economic returns to well-educated and poorly-educated workers. According to this explanation, employers in recent years were more willing to pay wage premiums for highly-skilled workers as the supply of these workers began to grow more slowly. Skill-biased technological change, or technical changes in production processes and techniques requiring skilled workers, are thought to be related to this shift in labor demand. Wages for the less skilled, on the other hand, changed very little in recent years or even declined. Immigration patterns and the Nation's trade deficit are suggested as being related to the growing skill gap in wages. The former have added to the pool of native-born workers with low education levels thereby depressing wages, while the latter has affected the number of available jobs and wage levels. Declining unionization may have

also exacerbated the trend in wage inequality, especially among low-skilled workers. Some researchers who have examined recent trends in income and income inequality have included not only economic variables in their analyses but demographic and social ones as well. For example, a recent Census Bureau study investigated the impact of changes over the last two decades in seven economic, social, and demographic characteristics of households.<sup>19</sup> While changes in the industrial attachment of householders (i.e., from goods-producing to service-producing industries) were found to have exerted a downward pressure on incomes and exacerbated income inequality, so too did changes in household composition or living arrangements (i.e., the shift away from married-couple families to single-parent and nonfamily households). In addition, this research demonstrated the strong positive influence on income trends of increases in the educational attainment of householders.

## DISTRIBUTION OF INCOME-TO-POVERTY RATIOS

Comparisons of income used throughout this report, for the most part, do not take into account differences in the number of family members with whom resources are shared or the economies of scale available to family members living together. A four-person family, for example, with an income of \$25,000 is not as well-off as a two-person family with the same income. Furthermore, economies of scale take into account such things as the sharing of rent and other fixed expenses which allow two people to live more cheaply together than separately.

In order to measure differences in income while accounting for differences in family size and economies of scale, comparison of family incomes in this section are made using income-to-poverty ratios. Income-to-poverty ratios adjust the family income by using poverty thresholds as an "equivalence scale."<sup>20</sup> For example, a four-person family containing two related children under 18 with an income in 1991 of \$25,000 would have an income-to-poverty ratio of 1.81 (i.e., \$25,000/\$13,812). A two-person family with a householder under 65 years old and no related children with an income of \$25,000 in

<sup>16</sup>Rising inequality is not limited to the United States. Other countries have also experienced this trend. See "International Comparisons of Earnings Inequality for Men in the 1980's," by Gordon Green, John Coder, and Paul Ryscavage, presented at a conference on the Distribution of Wealth and Income at the Jerome Levy Economics Institute of Bard College on October 19 and 20, 1990.

<sup>17</sup>See, for example, David M. Cutler and Lawrence F. Katz, "Macroeconomic Performance and the Disadvantaged," *Brookings Papers on Economic Activity*, 1991, (2), pp. 1-74.

<sup>18</sup>For a thorough review of the explanations for rising wage and earnings inequality, see Frank Levy and Richard Murnane, "Earnings Levels and Earnings Inequality: A Review of Recent Trends and Proposed Explanations," *Journal of Economic Literature*, September 1992 (forthcoming).

<sup>19</sup>Paul Ryscavage, Gordon Green, and Edward Welniak, "The Impact of Demographic, Social, and Economic Change on the Distribution of Income." This and three other recent papers by Census Bureau staff on income distribution are published in the *Current Population Reports, Series P-60, No. 183, "Studies in Income Distribution,"* (forthcoming).

<sup>20</sup>Equivalence scales are used generally to bring the incomes of households or families of different size and composition to the same level of economic well-being. For information about assumptions implicit in poverty thresholds, see Orshansky, Mollie, "Counting the Poor: Another Look at the Poverty Profile," reprinted from *January 1965 in Social Security Bulletin*, October 1988. Volume 51, Number 10, pages 25-51.

1991 would have a much higher ratio of 2.74 (\$25,000/\$9,120). A ratio under 1.00 indicates that the family was below the poverty level during the calendar year. Income-to-poverty ratios, presented in tables B-8 and B-9, adjust for family size and economies of scale, enabling more reasonable comparisons of economic well-being between families.<sup>21</sup>

Income-to-poverty ratios are also useful for comparing the economic well-being of families over time. In terms of economic well-being, a family's income could change while their income-to-poverty ratio remained the same, if there was a concurrent change in family size. For example, in 1991 the income-to-poverty ratio of a four-person family with two related children under 18 years old and a total family income of \$25,000 was 1.81. If the family income decreased to \$19,900 and the family also lost an adult member, the income-to-poverty ratio would remain at 1.81. Thus this family would be characterized as having no change in economic well-being as measured by income-to-poverty ratios. In terms of family income alone, this family would be characterized as experiencing a 20-percent decline. The benefit of using income-to-poverty ratios, rather than family income alone, to examine changes in economic well-being over time is based on the assumption that family resources are shared among its members.

The distribution of average income-to-poverty ratios for families by income quintile, presented in table B-8, shows that in 1991 for families with incomes in the lowest quintile, the average income-to-poverty ratio was 0.94. This implies that, on average, families in this quintile had incomes below the poverty level (a ratio of less than 1.00). At the opposite end of the distribution, the average income-to-poverty ratio for families in the highest quintile was 8.40.

The percent changes in the average income-to-poverty ratios for families since 1982, the end of the last recession, vary by quintile. Families in the second and middle quintiles experienced increases of 8.3 percent and 9.0 percent, respectively.<sup>22</sup> The increases for the fourth and fifth quintiles were higher, 11.9 percent and 21.0 percent, respectively. The average income-to-poverty ratio of families with incomes in the lowest quintile did not change significantly between 1982 and 1991.

Since the CPS is a cross-sectional survey, it can only provide a series of snapshots of the socioeconomic conditions that exist at different fixed points in time. The Survey of Income and Program Participation (SIPP), a

longitudinal survey, provides information making it possible to measure the extent to which individuals and population subgroups experience year-to-year changes in economic well-being.<sup>23</sup>

In order to incorporate the effect of possible month-to-month changes in family composition, data from the SIPP are presented for persons rather than families. Persons are characterized by the income of their respective family unit based on living arrangements each month during the calendar year. Table B shows the percent changes in income-to-poverty ratios between 1987 and 1988 from the SIPP.

While annual aggregate data from the CPS rarely show large increases or decreases in incomes, data from the SIPP show that economic conditions of families and persons can vary greatly from one year to the next. For example, while data from the CPS indicate that between 1987 and 1988 income-to-poverty ratios were virtually unchanged,<sup>24</sup> data from the SIPP show that 32.3 percent of persons experienced declines of 5-percent or more in their income-to-poverty ratios. (See table B.) About 12.5 percent experienced declines between 5 to 19 percent, and 19.8 percent experienced declines of 20 percent or more. On the other hand, 44.2 percent of persons experienced increases of 5 percent or more. These persons were equally distributed between those who experienced increases of 5 to 19 percent and those who experienced increases of 20 percent or more.<sup>25</sup>

A higher percentage of persons with an initial income-to-poverty ratio of 5.00 or more in 1987 experienced declines of 20 percent or more (23.4 percent), compared with persons with income-to-poverty ratios of less than 1.00 (12.3 percent), and of 1.00 to 2.99 (18.4 percent). (See figure 4.) In contrast, the percentages of persons experiencing increases of 20 percent or more in their income-to-poverty ratios were at least twice as high for persons with ratios of less than 1.00, and 1.00 to 2.99 (41.1 percent and 25.4 percent, respectively) than for those with income-to-poverty ratios of 5.00 or more (12.4 percent).

Changes in economic well-being, as measured by income-to-poverty ratios, are more likely for some population subgroups than for others.

<sup>23</sup>See appendix C, "Definitions, Explanations, and Comparability of Data," for a discussion of the concepts used in the SIPP; and Current Population Reports, Series P-70, No. 24, "Transitions in Income and Poverty Status: 1987-88," for an overview of the SIPP and a detailed explanation of the concepts used in that survey.

<sup>24</sup>There was no statistically significant change between the 1987 and 1988 average income-to-poverty ratios for the first, second, middle, and fourth quintiles. The fifth quintile, however, experienced a 1.5-percent increase.

<sup>25</sup>Data from SIPP also indicate that persons are quite likely to experience year-to-year changes in family income quintiles. For example, of persons in the lowest income quintile in 1987, 17 percent were in another quintile in 1988. See Current Population Reports, Series P-70, No. 24, "Transitions in Income and Poverty Status: 1987-1988," for further details.

<sup>21</sup>For information on poverty thresholds and guidelines, see Current Population Reports, Series P-60, No. 181, "Poverty in the United States: 1991."

<sup>22</sup>There is no statistically significant difference between the increases for the second and middle quintiles.

**Table B. Distribution of Percent Change in Income-to-Poverty Ratios Between 1987 and 1988: Survey of Income and Program Participation**

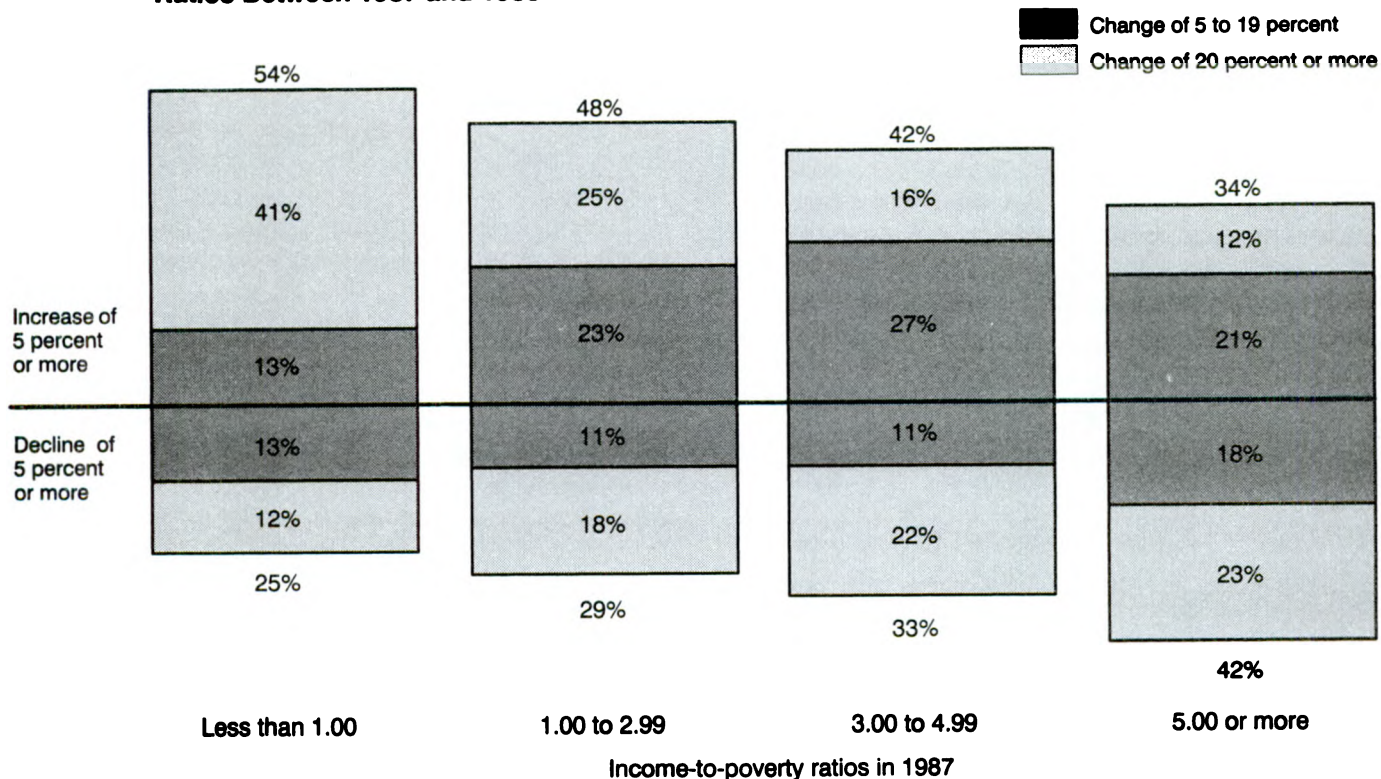

Characteristic	Total (thous.)	Change of 5 percent or more	Declined 5 percent or more			Increased 5 percent or more		
			Total	5 to 19 percent	20 percent or more	Total	5 to 19 percent	20 percent or more
<b>ALL PERSONS</b>

Did not work .....	5,465	85.1	54.4	29.1	25.4	30.7	12.1	18.6

**Age.** Elderly persons seemed to have the most stable income; only 59.4 percent of persons 65 years old and over experienced a change of 5 percent or more in their income-to-poverty ratios compared with 76.5 percent for the general population. The change for elderly persons was evenly distributed among those experiencing declines and increases of 5 percent or more. In contrast, persons 18 to 24 years old seemed to have the least stable income; 82.8 percent experienced a change of 5 percent or more in their income-to-poverty ratios. About 50.6 percent of these persons experienced increases and 32.2 percent experienced declines.

**Family status.** Persons who had a change in family status during the 24-month period of January 1987 to December 1988 were more likely to experience a 5 percent or more change in their income-to-poverty ratios than persons who maintained their family status. Ninety-one percent of persons who had a change in family status experienced a change of 5 percent or more in their ratios, compared with 75.8 percent of persons who did not have a change in family status. The direction of the change, whether an increase or decrease, depended largely on the type of family status the person was exiting and entering.

**Figure 4.**  
**Percent of Persons Experiencing Changes In Income-to-Poverty**  
**Ratios Between 1987 and 1988**

Source: Survey of Income and Program Participation

Persons who made the transition to a married-couple family from another type of family were more likely to experience increases of 5 percent or more in their income-to-poverty ratios than those making a change in the reverse order. Of the persons that became members of a married-couple family, 65.7 percent experienced increases of 5 percent or more in their income-to-poverty ratios, with 58.0 percent experiencing increases of 20 percent or more.<sup>29</sup> Twenty-nine percent experienced declines of 5 percent or more, with one-half having declines of 20 percent or more. On the other hand, for persons changing from being a member of a married-couple family to a member of another type of family, a decline in economic well-being was more likely. Only 31.4 percent of these persons experienced increases of 5 percent or more in their income-to-poverty ratio, while 58.5 percent experienced declines; about one-third of these were declines of 20 percent or more.

A larger proportion of persons who were family members one year and unrelated individuals in the following year experienced declines of 5 percent or

more in their income-to-poverty ratios than those making a change in the reverse order. Of persons changing from a family member to an unrelated individual, 63.7 percent experienced declines of 5 percent or more in the income-to-poverty ratios, while only 25.9 percent experienced increases of 5 percent or more. In contrast, 62.5 percent of persons changing from an unrelated individual to a family member experienced an increase of 5 percent or more in their income-to-poverty ratios, with only 26.1 percent experiencing declines.

**Work experience.** Changes in work experience are likely to be accompanied by changes in income-to-poverty ratios. Eighty-six percent of persons who had a change in work experience status experienced a change of 5 percent or more in their income-to-poverty ratios, compared with 73.4 percent of those who did not experience a change in work status. Of those that experienced a change in work experience status, 47.0 percent experienced increases and 38.8 percent experienced declines.

As may be expected, of those changing work status, persons who changed from year-round, full-time status to not working had the highest proportion experiencing a decline of 5 percent or more in their income-to-poverty ratio (85.0 percent). Those persons who changed to

<sup>29</sup>The difference between the proportion that experienced increases of 5 percent or more in their income-to-poverty ratios and those that experienced an increase of 20 percent or more is not statistically significant.

year-round, full-time status from not year-round, full-time status had the highest proportion experiencing increases of 5 percent or more (68.0 percent).

## STATE INCOME DATA

Tables C, and B-20 of this report show information on median household income by State. These data are being made available to meet the large number of requests received from data users regarding sub-national income estimates.

The CPS is a survey of about 60,000 households nationwide. This survey is designed to collect reliable data on income primarily at the national level and secondarily at the regional level. When the income data are tabulated by State and metropolitan area, the estimates are considered less reliable and, therefore, particular caution should be used when trying to interpret the results. To reduce the chances of misinterpreting annual changes in State and metropolitan area income estimates, the Census Bureau chose to evaluate changes based on 2-year averages.

Median income of households and the respective standard errors for States and the Los Angeles and New York Consolidated Metropolitan Statistical Areas (CMSA's) for 1989, 1990, and 1991 (in 1991 constant dollars) are shown in table C. This table also includes two 2-year averages of median household income, for 1989-1990 and 1990-1991. Numerical differences and percent changes between the 2-year averages by State are also shown.

Appendix B also includes a table showing median household income data by State. Table B-20 shows the median income of households by State for 1984-1991.

Based on the two 2-year averages, 1989-90 and 1990-91, real median household income declined significantly for 15 States. (See table C and figure 5.) These States were California, Florida, Georgia, Illinois, Massachusetts, Minnesota, Mississippi, New Hampshire, New Jersey, New York, North Carolina, Ohio, Utah, Vermont, and Wyoming. The same type of comparison shows that the median household income of the remaining 35 States and the District of Columbia did not change significantly.

Comparing the income among the States using the 3-year average of 1989-1991 shows that Mississippi had the lowest median household income in the Nation. Conversely, the median household income of Connecticut, although not statistically different from that of New Jersey and Alaska, was higher than the incomes of the remaining 47 States and the District of Columbia. The relative standing of the remaining States and the District of Columbia is less clear because of sampling variability surrounding the estimates.

## HEALTH INSURANCE COVERAGE

This is the first time this report presents data on health insurance. Although health insurance coverage is not a direct source of cash income, health insurance coverage is important to overall economic well-being. Thus, it is important to examine year-to-year changes in health insurance coverage, just as we examine annual changes in income, to provide a comprehensive picture of changes in economic status.<sup>27</sup>

Table D shows the health coverage rate by type of coverage in 1990 and 1991. The number of persons without health insurance in 1991 was 35.4 million, an increase from the 1990 estimate of 34.7 million. The percentage of the population without health insurance remained essentially unchanged at 14.1 percent. There was, however, a decline in the group health insurance coverage rate between 1990 and 1991 (60.4 percent in 1990 compared with 59.7 percent in 1991). This decline was offset by an increase in the government health insurance coverage rate between 1990 and 1991, 24.5 to 25.4 percent. In particular, Medicaid coverage, increased from 9.7 percent in 1990 to 10.7 percent in 1991.

Of persons between the ages 18 and 24, 26.9 percent lacked health insurance coverage in 1991, the highest percentage of any age group. In contrast, only 0.9 percent of persons 65 years old and over lacked health insurance coverage (96.0 percent of the elderly were covered by Medicare). A large majority (67.7 percent) of the elderly were covered by private health insurance in 1991, an indication of the extent to which the elderly supplement their Medicare coverage with private health plans.

Table E shows the percent of persons not covered by health insurance, by State and the District of Columbia for 1989, 1990, and 1991. Based on changes in 2-year averages, nine States and the District of Columbia showed significant changes in the percent of the population without health insurance coverage. Three showed greater coverage (Alaska, Colorado, and Pennsylvania) while the remaining six and the District of Columbia showed less coverage (Illinois, Massachusetts, Ohio, Utah, Vermont, and Virginia).

## CHANGES IN THE EDUCATIONAL ATTAINMENT ITEM

Beginning in January 1992, the CPS began using an educational attainment question similar to that used in the 1990 Decennial Census of Population and Housing. This section briefly discusses the form of the new

<sup>27</sup>For a discussion of the effect of valuing employer-subsidized health insurance, Medicaid, and Medicare on income, see the Current Population Reports, Series P-60, No. 182-RD, "Measuring the Effect of Benefits and Taxes on Income and Poverty: 1979 to 1991."

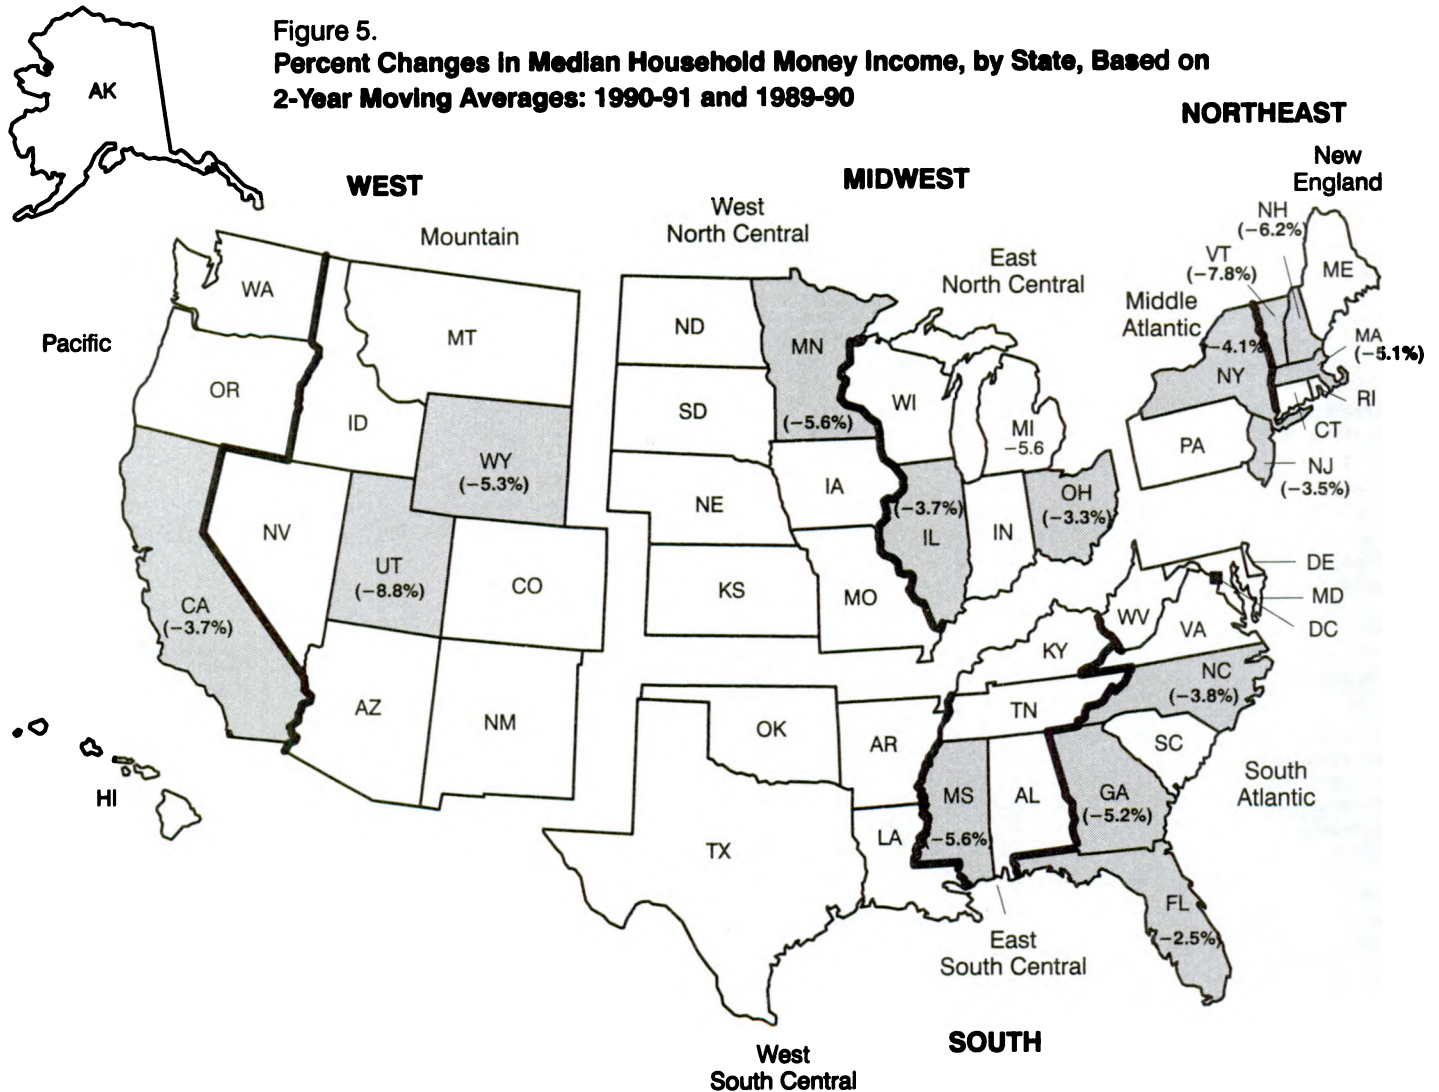

Table C. Median income of Households (in 1991 CPI-U-X1 Adjusted Dollars), by State: 1989, 1990, and 1991

**Figure 5.**  
**Percent Changes in Median Household Money Income, by State, Based on**  
**2-Year Moving Averages: 1990-91 and 1989-90**

Shaded areas = States experiencing significant declines in median household income.

Unshaded areas = States not experiencing a significant change in median household income. (No States experienced significant increases in median household income.)

question, some of the motivating factors behind the change, and addresses some of the concerns data users may have regarding the change.

The educational attainment item used in the CPS prior to 1992 had been virtually unchanged since the 1940's. This item was a two-part question which allowed the respondent to report the highest grade that was attended and whether the grade was completed. (See figure 6.)

The new educational attainment question introduced in January 1992 differs from the old question in the following manner (see figure 7):

- a single question is now asked
- response categories for lower levels of schooling have been collapsed into several summary categories
- a new category, "12th grade, No Diploma," has been added

- beginning with the response, "High School Graduate - high school diploma or the equivalent (for example GED)," the categories identify specific degree completion levels, rather than years of school completed

The focus of the question remains "regular" schooling, that is, schooling which is a part of the collegiate system. No attempt has been made to incorporate post secondary educational attainment from institutions other than the regular college system.

The change in the educational attainment item was motivated by a combination of factors. The main factors were:

1. the misclassification of years of schooling completed into degrees
2. the inability to identify specific degrees

Table D. Health Insurance Coverage Status—Persons, by Age: 1990 and 1991

### 3. uncertainty in the classification of high school graduates

### 4. programmatic and legislative data needs

The change in the collection of data on educational attainment raised some concern. One concern was the loss in continuity with a time series that dated back as much as 50 years. The meaning of the old question itself, however, had not remained constant. In 1940 for example, it could be said with a high degree of certainty that a person completing 4 years of college received a Bachelor's degree, the same assumption could not be made with the same level of certainty for data collected in 1990. Using the old item today and benchmarking it against 1940 would be misleading, with the problem becoming more serious with each passing year.

The new item, on the other hand, allows comparable construction of many of the educational attainment concepts and benchmarks that are frequently used in research, analysis, and legislation. Persons with less than a high school diploma, for example, can be easily identified, including the 12th graders who are not graduates. Persons with less than (more than) a Bachelor's degree can also be determined, as can those who have attained a Bachelor's as their highest degree. In this respect the new item will provide better year-to-year comparability, since it relies on known degree attainment, not a translation of years to degrees.

Another concern is the elimination of summary measures such as median or average years of schooling completed. During the entire decade of the 1980's, median years of schooling for persons ages 25 and above changed by two-tenths of a year, going from 12.5 to 12.7 years, emphasizing the fact that the median is not a very good summary measure to detect changes in educational attainment. The table below shows four different summary measures, including the median. Note that the three proportionate measures all tell a much stronger story than the median on how the population educational profile changed during the sixteen year period from 1975 to 1991.

Measure	1975	1991
Median years of schooling .....	12.3	12.7
Percent high school graduates.....	62.5	78.4
Percent with 1 or more years college...	26.3	39.8
Percent with 4 or more years college...	13.9	21.4

The change in the attainment question will end a time series for median years of schooling, however, the utility of the measure is questionable since it almost totally misses the dynamic changes that occurred in the educational profile of the United States.

In summary, changing patterns of enrollment and perceptions of education as human capital required a

 Elementary ..... E1–E8  
 High school ..... H1–H4  
 College  
 (Academic) ..... C1–C5,C6

Figure 7.  
**New Educational Attainment Question Introduced to the CPS in 1992**

23. What is the highest level of school ... has completed or the highest  
 degree ... has received?

**Education Codes for 23**

31 Less than 1st grade  
 32 1st, 2nd, 3rd, or 4th grade  
 33 5th or 6th grade  
 34 7th or 8th grade  
 35 9th grade  
 36 10th grade  
 37 11th grade  
 38 12th grade NO DIPLOMA  
 39 HIGH SCHOOL GRADUATE – high school DIPLOMA, or the equivalent  
 (For example: GED)  
 40 Some college but no degree  
 41 Associate degree in college – Occupational/vocational program  
 42 Associate degree in college – Academic program  
 43 Bachelor's degree (For example: BA, AB, BS)  
 44 Master's degree (For example: MA, MS, MEng, MEd, MSW, MBA)  
 45 Professional School Degree (For example: MD, DDS, DVM, LLB, JD)  
 46 Doctorate degree (For example: PhD, EdD)

serious re-examination of the usefulness of the attainment question. The growing importance of post-secondary education and the increasing credentialing of individuals dictated that more direct measures be used. The new educational attainment item is a departure from the past, but it provides more relevant and useful data.

## **USER COMMENTS**

We are interested in your reaction to the usefulness of the information provided in this report and to the content of the questions used to provide these results. We welcome your recommendations for improving our survey work. If you have suggestions or comments, please fill out the questionnaire at the beginning of this report or write to:

**Edward Welniak**

Washington, D.C. 20233-3300

## **SYMBOLS USED IN TABLES**

-	Represents zero or rounds to zero.
B	Base less than 75,000.
NA	Not available.
r	Revised
X	Not applicable.

**Table 1. Median Income of Households, by Selected Characteristics, Race, and Hispanic Origin of Householder: 1991, 1990, and 1989**

[Households as of March of the following year. An asterisk (\*) preceding percent change indicates statistically significant change at the 90-percent confidence level. For meaning of symbols, see text]

Characteristic	1991			1990			1989			Percent change in real median income (1990-91)

## **Appendix A. Bureau of Labor Statistics' Statement on the Use of the CPI-U-X1**

---

The Bureau of Labor Statistics (BLS) developed an experimental Consumer Price Index (CPI-U-X1) for researchers who wish to make historical comparisons with the current Consumer Price Index for All Urban Consumers (CPI-U) which uses the rental equivalence approach to measuring shelter services. Prior to 1983, the measurement of homeowner costs included changes in the asset value of homes. Recognizing that this approach mixed the investment and consumption aspects of homeownership, the BLS initiated an extensive research effort in the early 1970's to develop a better methodology. Following extensive study and testing, the CPI-U was officially converted to a rental equivalence measure in 1983. This rental equivalent approach is a methodology that isolates the shelter services component and, therefore, is a superior measure.

When the new methodology was introduced, the historical series were not revised. Price indexes are used for escalation and other contractual purposes that

require the parties to agree on one official series. Moreover, the BLS did not have the basic data or the resources to convert all of its historical series (including local area indexes) to the new methodology. The refinements that were ultimately developed before the methodology was officially introduced into the CPI—notably a larger sample of renters and a reweighting of the shelter component—could not be incorporated into the CPI-U-X1. Nonetheless, for many purposes the CPI-U-X1 can serve as an adequate proxy for what the national index would have been using the rental equivalence measure. Therefore, BLS recommends the use of the CPI-U-X1 to those who need to use a CPI series that treats homeowner costs consistently over time.

Bureau of Labor Statistics  
U.S. Department of Labor  
July 1989

## Appendix B. Time Series Estimates of Income (Using CPI-U-X1 Price Deflators) and State Income Data

Included in this appendix are time series estimates of income by selected characteristics of households, families, and persons; per capita income; and household income by State. In order to accurately assess changes over time in economic well-being, an adjustment for changes in the cost of living is required. Beginning with this report, the Census Bureau will be using the experimental Consumer Price Index (CPI-U-X1), provided by the Bureau of Labor Statistics for 1967 through 1991, to adjust for changes in the cost of living.<sup>1</sup> Earlier reports in this series used the CPI-U to adjust income when making comparisons over time. See Appendix A, "Bureau of Labor Statistics' Statement on the Use of the CPI-U-X1," and the Current Population Report, P-60, No. 174, *Money Income of Households, Families, and Persons in the United States: 1990*, for a discussion of the uses of the CPI-U-X1 and CPI-U as price deflators.

The indexes used to make the constant dollar conversions are shown in table B-1. Tables B-2 through B-5

<sup>1</sup>The experimental Consumer Price Indexes (CPI-U-X1) included in this appendix for years prior to 1967 were derived by applying the CPI-U-X1-to-CPI-U ratio for 1967 to the 1947 through 1966 CPI-U indexes.

show inflation adjusted median incomes of households by selected characteristics. Tables B-6 through B-8 and B-10 through B-13 show median incomes of families by selected characteristics. Table B-9 shows income-to-poverty ratios for unrelated individuals. Tables B-14 through B-18 show median incomes of persons by selected characteristics. Table B-19 shows per capita income in 1967 to 1991 by race and Hispanic origin. Table B-20 shows the median income of households by State for the time period 1984 through 1991. Periods of recession from 1948 to present are shown below.

### Periods of Recession

Peak month	Year	Trough month	Year

**Table B-1. Annual Average Consumer Price Index (CPI-U-X1): 1947 to 1991**

(1982-84 = 100.0)

Year	CPI-U-X1 <sup>1</sup>	Year	CPI-U-X1 <sup>1</sup>
1947	24.2	1970	41.3
1948	26.2	1971	43.1
1949	25.9	1972	44.4
		1973	47.2
1950	26.2	1974	51.9
1951	28.3	1975	56.2
1952	28.8	1976	59.4
1953	29.0	1977	63.2
1954	29.2	1978	67.5
1955	29.1	1979	74.0
1956	29.6		
1957	30.5	1980	82.3
1958	31.4	1981	90.1
1959	31.6	1982	95.6
		1983	99.6
1960	32.2	1984	103.9
1961	32.5	1985	107.6
1962	32.8	1986	109.6
1963	33.3	1987	113.6
1964	33.7	1988	118.3
1965	34.2	1989	124.0
1966	35.2		
1967	36.3	1990	130.7
1968	37.7	1991	136.2
1969	39.4		

<sup>1</sup>Prior to 1967, the CPI-U-X1 indexes included in this table were derived by applying the CPI-U-X1 ratio calculated for 1967 to the 1947 to 1966 CPI-U indexes.

NOTE: The percentage change in prices between earlier years data and 1991 should be computed by dividing the annual average Consumer Price Index (CPI-U-X1) for 1991 by the annual average for the earlier year(s).

**Table B-2. Households, by Total Money Income, Race, and Hispanic Origin of Householder: 1967 to 1991**

[Income in 1991 CPI-U-X1 adjusted dollars. Households as of March of the following year. For meaning of symbols, see text]

<sup>1</sup>Implementation of a new March CPS processing system.

<sup>2</sup>Implementation of Hispanic population controls.

<sup>3</sup>Implementation of 1980 census population controls.

<sup>4</sup>Implementation of a new March CPS processing system.

<sup>5</sup>Persons of Hispanic origin may be of any race. Income data for Hispanic origin families are not available prior to 1972.

**Table B-7. Share of Aggregate Income and Mean Income in 1967 to 1991 Received by Each Fifth and Top 5 Percent of Families, by Race and Hispanic Origin**

(Families as of March of the following year. Mean incomes are in 1991 CPI-U-X1 dollars.)

Year	Number (thous.)	Percent distribution of aggregate income						Mean income (dollars)						Mean income (dollars)	Gini ratio
		Lowest fifth	Second fifth	Third fifth	Fourth fifth	Highest fifth	Top 5 percent	Lowest fifth	Second fifth	Third fifth	Fourth fifth	Highest fifth	Top 5 percent

<sup>1</sup>Implementation of a new March CPS processing system.

<sup>2</sup>Implementation of Hispanic population weighting controls.

<sup>3</sup>Implementation of 1980 census population controls.

<sup>4</sup>Implementation of a new March CPS processing system.

<sup>5</sup>Persons of Hispanic origin may be of any race.

NOTE: Average income-to-poverty ratios are computed by dividing the mean income of families in each quintile by the mean poverty threshold of the families. For information on the derivation of poverty thresholds, see Current Population Reports, Series P-60, No. 181, *Poverty in the United States: 1991*.

**Table B-9. Average Income-to-Poverty Ratios for Unrelated Individuals, by Income Quintile, Race, and Hispanic Origin: 1967 to 1991**

<sup>1</sup>Implementation of a new March CPS processing system.

<sup>2</sup>Implementation of Hispanic population weighting controls.

<sup>3</sup>Implementation of 1980 census population controls.

<sup>4</sup>Implementation of a new March CPS processing system.

<sup>5</sup>Persons of Hispanic origin may be of any race.

NOTE: Average income-to-poverty ratios are computed by dividing the mean income of unrelated individuals in each quintile by the mean poverty threshold of unrelated individuals. For information on the derivation of poverty thresholds, see Current Population Reports, Series P-60, No. 181, *Poverty in the United States: 1991*.

**Table B-10. Age of Householder—Families by Median Money Income: 1947 to 1991**

<sup>1</sup>Implementation of a new March CPS processing system.

## Appendix C. Definitions, Explanations, and Comparability of Data

### DEFINITIONS AND EXPLANATIONS

**Population coverage.** This report includes the civilian noninstitutional population of the United States and members of the Armed Forces in the United States living off post or with their families on post, but excludes all other members of Armed Forces.

**Farm-nonfarm residence.** The farm population refers to rural residents living on farms. The March 1980 CPS to March 1992 CPS employed a different definition of a farm than used in Current Population Surveys or decennial censuses before 1980. Under the new definition, as used in the 1974 Census of Agriculture, a farm is any place in rural territory from which \$1,000 or more of agricultural products were sold in the reporting year. All other households were classified as nonfarm, which comprises persons living in urban areas and persons not on farms living in rural areas. Rural persons in institutions, motels, and tourist camps, and those living on rented places where no land is used for farming are classified as nonfarm population. According to the old definition, farm residence was determined by responses to two questions: (1) "Does this place you (own/rent) have 10 acres or more?" and (2) "During the past 12 months, how much did sales from this place amount to (under \$50, \$50 to \$249, \$250 to \$999, or \$1,000 or more)?" The household was classified as being in the farm population if either (a) the acreage response was "yes" and sales amounted to \$50 or more or (b) the acreage response was "no" and sales amounted to \$250 or more.

**Metropolitan-nonmetropolitan residence.** The population residing in metropolitan statistical areas (MSA's) as defined in June 1984 constitutes the metropolitan population. MSA's are defined by the Office of Management and Budget for use in the presentation of statistics by agencies of the Federal Government. An MSA is a geographic area consisting of a large population nucleus, together with adjacent communities which have a high degree of economic and social integration with that nucleus. The definitions specify a boundary around each large city so as to include most or all its suburbs. Entire counties form the MSA building blocks, except in New England where cities and towns are used. The former term SMSA was changed to MSA in 1983.

An area qualifies for recognition as an MSA if (1) it includes a city of at least 50,000 population, or (2) it

includes a Census Bureau-defined urbanized area of at least 50,000 with a total metropolitan population of at least 100,000 (75,000 in New England). In addition to the county containing the main city or urbanized area, an MSA may include other counties having strong commuting ties to the central county. If specified conditions are met, certain large MSA's are designated as consolidated MSA's (CMSA's) and divided into component primary MSA's (PMSA's). References to metropolitan-nonmetropolitan residence by size are based on the population of the CMSA.

**Central cities.** The largest city in each MSA is always designated a central city. There may be additional central cities if specified requirements, designed to identify places of central character within the MSA, are met. Although the largest central cities are generally included in the title of the MSA, there may be central cities that are not part of the title. The balance of the MSA outside the central city or cities often is regarded as equivalent to "suburbs."

**Geographic regions.** The four major regions and nine Census divisions of the United States for which data are presented in this report represent groups of States as follow:

#### *Northeast:*

*New England:* Connecticut, Maine, Massachusetts, New Hampshire, Rhode Island, and Vermont.

*Middle Atlantic:* New Jersey, New York, and Pennsylvania.

#### *Midwest (formerly North Central):*

*East North Central:* Illinois, Indiana, Michigan, Ohio, and Wisconsin.

*West North Central:* Iowa, Kansas, Minnesota, Missouri, Nebraska, North Dakota, and South Dakota.

#### *South:*

*South Atlantic:* Delaware, District of Columbia, Florida, Georgia, Maryland, North Carolina, South Carolina, Virginia, and West Virginia.

*East South Central:* Alabama, Kentucky, Mississippi, and Tennessee.

**West South Central:** Arkansas, Louisiana, Oklahoma, and Texas.

**West:**

**Mountain:** Arizona, Colorado, Idaho, Montana, Nevada, New Mexico, Utah, and Wyoming.

**Pacific:** Alaska, California, Hawaii, Oregon, and Washington.

**North and West:**

**Northeast, Midwest, and West combined.**

**Tenure.** A housing unit is "owner occupied" if the owner or co-owner lives in the unit, even if it is mortgaged or not fully paid for. A cooperative or condominium unit is "owner occupied" only if the owner or co-owner lives in it. All other occupied units are classified as "renter occupied," or "occupied without payment of cash rent". For some tabulations, the latter of the groups are combined into a single "renter occupied" group.

**Income.** (For the definition of income used in the SIPP, see the "Comparability of Current Population Survey Income Data with other Data" section of this appendix.) For each person in the sample 15 years old and over, questions were asked on the amount of money income received in the preceding calendar year from each of the following sources: 1) earnings from longest job (or self-employment); 2) earnings from jobs other than longest job; 3) unemployment compensation; 4) worker's compensation; 5) Social Security; 6) Supplemental Security income; 7) public assistance; 8) veterans' payments; 9) survivor benefits; 10) disability benefits; 11) pension or retirement income; 12) interest; 13) dividends; 14) rents, royalties, and estates and trusts; 15) educational assistance; 16) alimony; 17) child support; 18) financial assistance from outside of the household, and other periodic income.

It should be noted that although the income statistics refer to receipts during the preceding calendar year, the demographic characteristics such as age, labor force status, and family or household composition are as of the survey date. The income of the family/household does not include amounts received by persons who were members during all or part of the income year if these persons no longer resided in the family/household at the time of interview. However, income data are collected for persons who are current residents but did not reside in the household during the income year.

Data on consumer income collected in the CPS by the Bureau of the Census cover money income received (exclusive of certain money receipts such as capital gains) before payments for personal income taxes, Social Security, union dues, Medicare deductions, etc. Therefore, money income does not reflect the fact that some

families receive part of their income in the form of noncash benefits such as food stamps, health benefits, noncash benefits in the form of rent-free housing and goods produced and consumed on the farm; or that non-cash benefits are also received by some nonfarm residents which often take the form of the use of business transportation and facilities, full or partial payments by business for retirement programs, medical and educational expenses, etc. These elements should be considered when comparing income levels. Moreover, readers should be aware that for many different reasons there is a tendency in household surveys for respondents to underreport their income. From an analysis of independently derived income estimates, it has been determined that income earned from wages or salaries is much better reported than other sources of income, and is nearly equal to independent estimates of aggregate income.

The various sources for which income is reported are defined as follows:

Longest job and other employment earnings can be classified into the three types:

1. *Money wage or salary income* is the total received for work performed as an employee during the income year. It includes wages, salary, Armed Forces pay, commissions, tips, piece rate payments, and cash bonuses earned, before deductions were made for taxes, bonds, pensions, union dues, etc.
2. *Net income from nonfarm self-employment* is the net money income (gross receipts minus expenses) from one's own business, professional enterprise, or partnership. Gross receipts include the value of all goods sold and services rendered. Expenses include costs of goods purchased, rent, heat, light, power, depreciation charges, wages and salaries paid, business taxes (not personal income taxes), etc. In general, inventory changes were considered in determining net income; replies based on income tax returns or other official records do reflect inventory changes. However, when values of inventory changes were not reported, net income figures exclusive of inventory changes were accepted. The value of saleable merchandise consumed by the proprietors of retail stores is not included as part of net income.
3. *Net income from farm self-employment* is the net money income (gross receipts minus operating expenses) from the operation of a farm by a person on his own account, as an owner, renter, or sharecropper. Gross receipts include the value of all products sold, government farm programs, money received from the rental of farm equipment to others, rent received from farm property if payment is made based on a percent of crops produced and

incidental receipts from the sale of wood, sand, gravel, etc. Operating expenses include cost of feed, fertilizer, seed, and other farming supplies, cash wages paid to farmhands, depreciation charges, cash rent, interest on farm mortgages, farm building repairs, farm taxes (not State and Federal personal income taxes), etc. The value of fuel, food, or other farm products used for family living is not included as part of net income. In general, inventory changes were considered in determining net income only when they were accounted for in replies based on income tax returns or other official records which reflect inventory changes; otherwise, inventory changes were not taken into account.

**Unemployment compensation** includes payments received from government unemployment agencies or private companies during periods of unemployment and any strike benefits received from union funds.

**Workers compensation** includes payments received periodically from public or private insurance companies for injuries received at work.

**Social Security** includes Social Security pensions and survivors' benefits, and permanent disability insurance payments made by the Social Security Administration prior to deductions for medical insurance. Medicare reimbursements are not included.

**Supplemental Security income** includes payments made by Federal, State, and local welfare agencies to low income persons who are (1) 65 years old or over, (2) blind, or (3) disabled.

**Public assistance or welfare payments** include public assistance payments made to low income persons, such as aid to families with dependent children and general assistance.

**Veterans' payments** include payments made periodically by the Department of Veterans Affairs to disabled members of the Armed Forces or to survivors of deceased veterans for education and on-the-job training, and means-tested assistance to veterans.

**Survivor benefits** include payments from survivor or widows' pensions, estates, trusts, annuities, or any other types of survivor benefits. Payments can be reported from 10 different sources: 1) private companies or unions; 2) Federal government (Civil Service); 3) military; 4) state or local governments; 5) railroad retirement; 6) workers' compensation; 7) Black lung payments; 8) estates and trusts; 9) annuities or paid-up insurance policies; and 10) other survivor payments.

**Disability benefits** include all payments received as a result of a health problem or disability. Payments can be reported from 10 sources: 1) workers' compensation; 2)

companies or unions; 3) Federal government (Civil Service); 4) U.S. Military; 5) state or local governments; 6) railroad retirement; 7) accident or disability insurance; 8) Black lung payments; 9) state temporary sickness; or 10) other disability payments.

**Retirement benefits** include payments reported from 8 sources: 1) companies or unions; 2) Federal government (Civil Service); 3) U.S. Military; 4) state or local governments; 5) railroad retirement; 6) annuities or paid-up insurance policies; 7) IRA, KEOGH, or 401(k) payments; or 8) other retirement income.

**Interest income** includes payments received or credited to: savings accounts, bonds, Treasury notes, IRA's, certificates of deposit, interest-bearing checking accounts, and all open investments that pay interest.

**Dividends** include income received from stockholdings and mutual fund shares. Capital gains from the sale of stockholdings are not included as dividends.

**Rents, royalties, and estates and trusts** include the net income from the rental of a house, store, or other property, receipts from boarders or lodgers, net royalty income, and periodic payments from estate or trust funds.

**Educational assistance** includes Pell Grants, other government educational assistance, any scholarships or grants, or financial assistance from employers, friends, or relatives not residing in the students household.

**Child support** includes all periodic payments paid by parents for the support of children, even if these payments are made through a state or local government office.

**Alimony** includes all periodic payments to ex-spouses. One-time property settlements are not included.

**Financial assistance from outside of the household** includes periodic payments from nonhousehold members. Gifts or sporadic assistance are not included.

**Government transfers** include payments from the following sources: 1) Unemployment compensation, 2) State workers compensation, 3) Social Security, 4) Supplemental Security Income (SSI), 5) Public assistance, 6) Veterans' benefits, 7) government survivor benefits, 8) government disability benefits, 9) government pensions, and 10) government educational assistance.

**Other income** includes all other regularly received payments that are not included elsewhere on the questionnaire. Some examples include: state programs such as foster child payments, military family allotments, income received from foreign government pensions, etc.

**Receipts not counted as income** include: (1) capital gains such as money received from the sale of property, such as stocks, bonds, a house, or a car (unless the person was engaged in the business of selling such property, in which case the net proceeds would be counted as income from self-employment); (2) withdrawals of bank deposits; (3) money borrowed; (4) tax refunds; (5) gifts; and (6) lump-sum inheritances or insurance payments.

All sources of income may be combined into two major types:

**Total money earnings** is the algebraic sum of money wages and salary and net income from farm and non-farm self-employment.

**Income other than earnings** is the algebraic sum of all sources of money income except wages and salaries and income from self-employment.

**Median income.** Median income is the amount which divides the income distribution into two equal groups, half having incomes above the median, half having incomes below the median. The medians for households, families, and unrelated individuals are based on all households, families, and unrelated individuals. The medians for persons are based on persons 15 years old and over with income.

**Mean income.** Mean income is the amount obtained by dividing the total aggregate income of a group by the number of units in that group. The means for households, families, and unrelated individuals are based on all households, families, and unrelated individuals. The means for persons are based on persons 15 years old and over with income.

**Per capita income.** Per capita income is the mean income computed for every man, woman, and child in a particular group. It is derived by dividing the total income of a particular group by the total population in that group (excluding patients or inmates in institutional quarters).

**Index of income concentration or Gini Index.** This is a statistical measure of income inequality. A measure of 0 indicates perfect equality, i.e., all persons having equal shares of the income. A measure of 1 indicates perfect inequality, i.e., one person has all the income and the rest have none. For a more detailed discussion see Current Population Reports, Series P-80, No. 123.

**Average Income-to-Poverty Ratios.** These ratios represent the average ratio of family or unrelated individual income to their appropriate poverty threshold. Ratios below 1.00 mean that the average income for the respective families or unrelated individuals is below the

official poverty definition, while a ratio of 1.00 or greater indicates income above the poverty level. A ratio of 2.25, for example, indicates that on average, income was 125 percent above the appropriate poverty threshold. For a definition of poverty and the poverty thresholds in 1991, see Current Population Reports, Series P-80, No. 181.

**Households.** Households consist of all persons who occupy a housing unit. A house, an apartment or other group of rooms, or a single room is regarded as a housing unit when it is occupied or intended for occupancy as separate living quarters; that is, when the occupants do not live and eat with any other persons in the structure and there is direct access from the outside or through a common hall.

A household includes the related family members and all the unrelated persons, if any, such as lodgers, foster children, wards, or employees who share the housing unit. A person living alone in a housing unit, or a group of unrelated persons sharing a housing unit as partners, is also counted as a household. The count of households excludes group quarters.

**Group quarters.** Group quarters contain five or more persons unrelated to the person in charge, such as residents of lodging and boarding houses. All persons who are not members of households are regarded as living in group quarters. Persons living in military barracks and inmates of institutions were excluded from the survey.

**Householder.** The person (or one of the persons) in whose name the home is owned or rented. If the house is owned jointly by a married couple, either the husband or the wife may be listed first, thereby becoming the reference person, or householder, to whom the relationship of the other household members is recorded. One person in each household is designated as the "householder." The number of householders, therefore, is equal to the number of households.

**Head versus householder.** Beginning with the 1980 CPS, the Bureau of the Census discontinued the use of the terms "head of household" and "head of family." Instead, the terms "householder" and "family householder" are used. Recent social changes have resulted in greater sharing of household responsibilities among the adult members and, therefore, have made the term "head" increasingly inappropriate in the analysis of household and family data. Specifically, the Bureau has discontinued its longtime practice of always classifying the husband as the reference person (head) when he and his wife are living together.

**Families.** (For the definition of families used in the SIPP see the "Comparability of Current Population Survey Income Data With Other Data" section of this appendix.) Families are groups of two persons or more (one of

whom is the householder) related by birth, marriage, or adoption and residing together; all such persons (including related subfamily members) are considered as members of one family. Beginning with the 1980 CPS, unrelated subfamilies (referred to in the past as secondary families) were no longer included in the count of families, nor are the members of unrelated subfamilies included in the count of family members.

**Family households.** Family households are households maintained by a family (as defined above). Members of family households include any unrelated persons (unrelated subfamily members and/or secondary individuals) who may be residing there. The number of family households is equal to the number of families. The count of family household members differs from the count of family members, however, in that the family household members include all persons living in the household, whereas family members include only the householder and his/her relatives. (See the definition of family.)

**Unrelated subfamilies.** Formerly called secondary families, unrelated subfamilies include two persons or more who are related to each other by birth, marriage, or adoption, but who are not related to the householder. An unrelated subfamily may include persons such as guests, roomers, boarders, or resident employees and their relatives living in a household. The number of unrelated subfamily members is included in the number of household members but is not included in the count of family members.

Persons living with relatives in group quarters were formerly considered as members of unrelated subfamilies. However, the number of such unrelated subfamilies became so small (37,000 in 1967) that beginning with data for 1968 (and beginning with census data for 1960) the Bureau of the Census includes persons in these unrelated subfamilies in the count of secondary individuals.

**Married couples.** As defined for census purposes, married couples consist of a husband and wife enumerated as members of the same family household. A married couple may or may not have children living with them.

**Unrelated individuals.** These are persons (other than inmates of institutions) who are not living with any relatives. An unrelated individual may (1) constitute a one-person household, (2) be part of a household including one or more other families or unrelated individuals, or (3) reside in group quarters such as a rooming house. Thus, a widow living by herself or with one or more other persons not related to her, a lodger not related to the householder or to anyone else in the household, and a servant living in an employer's household with no relatives are examples of unrelated individuals.

**Nonfamily householders.** Formerly called primary individuals, nonfamily householders are persons maintaining a household while living alone or with nonrelatives only.

**Secondary individuals.** Secondary individuals are persons in households or group quarters such as guests, roomers, boarders, or resident employees (excluding nonfamily householders and inmates of institutions) who are not related to any other person in the household or group quarters. (See section on unrelated subfamily for slight change in coverage of secondary individuals in 1968.)

**Size of household or family.** The term "size of household" includes all persons occupying a housing unit. "Size of family" includes the family householder and all other persons in the living quarters who are related to the householder by birth, marriage, or adoption.

**Related children under 18 years of age.** In a family, related children under 18 years of age include sons and daughters, including stepchildren and adopted children, of the householder and all other children in the household who are related to the householder by blood, marriage, or adoption.

**Related persons and family members.** This includes all persons in the household related to the householder.

**Marital status.** This classification identifies four major categories: single, married, widowed, and divorced. These terms refer to the marital status at the time of interview.

The category "married" is further divided into "married, spouse present," "separated," and "other married, spouse absent." A householder is classified as "married, spouse present" if their spouse is reported as a member of the household, even though he or she might be temporarily absent on business or on vacation, visiting, in a hospital, etc., at the time of the interview. Persons reported as "separated" includes those with legal separations, those living apart with intentions of obtaining a divorce, and other persons permanently or temporarily separated because of marital discord. The group "other married, spouse absent" includes married persons living apart because either the wife or the husband is employed and living a considerable distance from home, is residing in an institution, has moved to another area, or has a different place of residence for any other reason except separation as defined above.

**Number of earners.** This includes all persons in the household with \$1 or more in wages and salaries or \$1 or more or a loss in net income from farm or nonfarm self-employment.

**Age.** This classification is based on the age of the person at his/her last birthday.

**Race.** Race is based on five groups: (1) White, (2) Black, (3) Asian or Pacific Islander, (4) American Indian, Aleut, or Eskimo, and (5) other.

**Hispanic origin.** Persons of Hispanic origin are identified by a question that asks for self-identification of the person's origin or descent. Respondents are asked to select their origin (and the origin of other household members) from a "flash card" listing ethnic origins. Persons of Hispanic origin, in particular, are those who indicate that their origin is Mexican, Puerto Rican, Cuban, Central or South American, or some other Hispanic origin. It should be noted that persons of Hispanic origin may be of any race.

**Educational Attainment.** This classification refers to the highest level of school completed or the highest degree received. The category, "Associate degree" includes persons whose highest degree is an associate degree either in (1) an occupational program that prepares them for a specific occupation, and the course work may or may not be creditable toward a bachelor's degree or (2) an academic program primarily in the arts and sciences, and the course work is transferrable to a bachelor's degree. Some examples of professional degrees include medicine, dentistry, chiropractic, optometry, osteopathic medicine, pharmacy, podiatry, veterinary medicine, law, and theology, but specifically exclude barber school, cosmetology, or other training for a specific trade.

Data on educational attainment are derived from a question that asks, "What is the highest level of school . . . has completed or the highest degree . . . has received?" The question on educational attainment applies only to progress in "regular" schools. Such schools include public, private and parochial elementary and high schools (both junior and senior), colleges, universities, and professional schools (whether day schools or night schools). Thus, regular schooling is that which may advance a person toward an elementary school certificate, a high school diploma, or a college, university, or professional school degree. Schooling in other than regular schools is counted only if the credits obtained are regarded as transferable to schools in the regular school system.

Beginning in January 1992, the CPS began using an educational attainment question similar to that used in the 1990 Decennial Census of Population and Housing. Consequently, data on educational attainment from the 1992 CPS are not directly comparable to CPS data for prior years. Prior to 1992, the CPS educational attainment data were derived from the combination of answers to questions concerning the highest grade of school attended by the person and whether or not that grade

was finished. For a discussion of the change in the form of the question and some of the motivating factors behind the change, see the introductory text of this report.

**Paid labor force.** Persons are classified in the paid labor force if they were employed as wage and salary workers or self-employed workers during the survey week or were looking for work at the time and had last worked as a wage and salary or self-employed worker.

**Occupation.** Occupation classification is based on the kind of work the person does on his/her job. If the person changed jobs, the data refer to the occupation of the job held longest during the previous calendar year. The current occupational groupings were derived from the classification system used in the 1990 Census of Population. Take note that data on occupations for 1991 are not fully comparable with data for prior years because of changes to the classification system at various points in time. Changes to the occupation classification system have occurred most recently for the income years 1991, 1982, and 1970.

**Work experience.** Work experience is based on work for pay or profit or work without pay on a family-operated farm or business at any time during the previous year, on a part time or full time basis.

**Weeks worked in the income year.** This is based on the number of different weeks, during the preceding calendar year, in which a person did any work for pay or profit (including paid vacations and sick leave) or worked without pay on a family-operated farm or business.

**Part-time or full-time employment.** Defined as follows: part-time indicates less than 35 hours of work per week in a majority of the weeks worked during the year. Full-time indicates 35 hours or more per week during a majority of the weeks worked.

**Year-round, full-time.** Indicates 50 or more weeks of full-time employment during the previous calendar year.

**Nonworkers.** Nonworkers are persons who did not do any work in the calendar year preceding the survey.

**Workers.** Persons who worked one or more days during the previous calendar year.

**Symbols.** A dash (-) represents zero or rounds to zero, the symbol "B" means that the base for the derived figure is less than 75,000, the symbol "X" means not applicable, the symbol "NA" means not available, and the symbol "r" means revised.

**Rounding.** Percentages are rounded to the nearest tenth of a percent; therefore, the percentages in a distribution do not always add to exactly 100.0 percent. The totals, however, are always shown as 100.0. Moreover, individual figures are rounded to the nearest thousand without being adjusted to group totals, which are independently rounded; percentages are based on the unrounded numbers.

**Base figures.** Since 1979, base figures are based on civilian noninstitutional population controls for age, race, and sex established by the 1980 census. The base figures shown for 1971 to 1978 were prepared by inflating weighted sample results to agree with independent estimates of the population based on statistics updated from the 1970 census, whereas the base figures for the years from 1961 to 1970 were inflated to estimates derived from the 1960 census. The data for the years prior to 1961 were based on the 1950 census.

**Computation of aggregate income by fifths.** The data shown on aggregate income and dollar cutoffs for fifths (and top 5 percent) of households and families, ranked by size of their total money income, were calculated using sorted microdata.

**Computation of constant dollar distributions.** For the years since 1967, adjustments for price change have been made by converting the incomes of households, families, or persons on the microdata file into constant dollars on the basis of the Consumer Price Index (CPI-U-X1). The microdata were then tallied into the appropriate income interval.

The indexes used to make the constant dollar conversions are shown in table B-1. The Consumer Price Index (CPI-U-X1) is an index designed to measure changes in family purchasing power. While the CPI is a good measure of the changes in prices paid by the average family represented in the index (urban consumers), it is not necessarily a good measure of the changes in prices faced by consumers of different characteristics and income levels. These limitations should be noted when comparing figures adjusted to constant dollars using the CPI since the same index was used for all families and all income levels.

## COMPARABILITY OF CURRENT POPULATION SURVEY INCOME DATA WITH OTHER DATA

### Survey of Income and Program Participation (SIPP) data.

The concepts used in the SIPP and the March supplement to the Current Population Survey (CPS), though similar, differ in some regards. These differences occur primarily between components of the income definition used in each survey and the manner in which certain reference units are categorized. An explanation of these differences follows.

Two basic units of reference common to both the SIPP and CPS are persons and households. Groups of persons living together, when combined based on relationship, form family units. A family refers to a group of two or more persons related by birth, marriage, or adoption who reside together (one of whom is the householder). Two or more people who live together and are related to one another, but not related to the householder, form an unrelated subfamily. Persons in unrelated subfamilies are not included in the count of family members in the CPS, but are included as family members for the SIPP.

A unique feature of a longitudinal survey, such as SIPP, is its ability to capture change over time. A cross-sectional survey, such as CPS, does not have this feature and can only provide a series of snapshots of the socio-economic conditions that exist at different fixed points in time. The CPS data presented in this report are based on the demographic characteristics as they existed at the time the survey was conducted, March 1992, and are applied to the economic characteristics that existed for the previous calendar year. The demographic data in the SIPP are collected with the economic data throughout the calendar year and are likely to have changed during the year. In order to incorporate the effect of changes over time in family composition in measures of SIPP income data, the data are presented for persons rather than families. Persons are characterized by the income of their respective family unit based on living arrangements each month during the calendar year.

The definition of income used in the SIPP is basically the same as in the CPS. It reflects money income before taxes and does not include the value of noncash benefits such as employer-provided health insurance, food stamps, or Medicaid. Differences do exist however, they are:

- **Accrued interest** on Individual Retirement Accounts (IRA's), KEOGH retirement plans, 401(k), and U.S. saving bonds; and **educational assistance** are excluded in SIPP and counted in the CPS.
- **Lump-sum or one-time payments** such as inheritances or insurance settlements are counted in the SIPP and excluded in the CPS.
- **Self-employment income** (both farm and nonfarm) is counted in the CPS as a net amount, gross receipts minus operating expenses. In the SIPP, earning from self-employment is based on the salary or draw received by the owner over the accounting period (4-month intervals).

For an overview of the SIPP and a detailed explanation of the concepts used in that survey, see *Current Population Reports, Series P-70, No. 24, Transitions in Income and Poverty Status: 1987-88*.

**Bureau of Economic Analysis (BEA) personal income series.** The income data presented in this report are not directly comparable with estimates of aggregate personal income prepared by the Bureau of Economic Analysis, Department of Commerce, nor with the distributions of families and unrelated individuals by family personal income brackets published by that Bureau between the years 1929 to 1963. The lack of correspondence stems from the following differences in definition and coverage:

1. *Income definition.* The personal income series include, among other items, the following types of non-money income which are not included in the Census definition: wages received in kind, the value of food and fuel produced and consumed on farms, the net rental value of owner-occupied homes, the property income received by mutual life insurance companies, and the value of the services of banks and other financial intermediaries rendered to persons without the assessment of specific charges. These items of income in kind account for about 4 percent of total personal income. The Census Bureau definition of income, however, includes such items as regular contributions for support received from persons who do not reside in the same living quarters, income received from roomers and boarders residing in households, and employee contributions for social insurance, which are not included in the personal income series. These items, however, represent a much smaller income total than the nonmoney items included in personal income.

2. *Source of data.* The personal income series is estimated largely on the basis of data derived from business and governmental sources. These sources include the industrial and population censuses, employer's wage reports under the Social Security programs, and records of disbursements to individuals by governmental agencies. The income data presented in the census reports, on the other hand, are based directly on field surveys of households.

As discussed in the section, "Source and Accuracy of Estimates," income data obtained in household interviews are subject to various types of reporting errors which tend to produce an understatement of income. It is estimated that the income surveys conducted by the Bureau of the Census during the past few years have obtained about 89 percent of the comparable total money income aggregates and about 99 percent of the comparable money wage or salary aggregates derived from the personal income series prepared by BEA.

For a more detailed discussion of the differences between distributions using Census money income and BEA personal income, see *Size Distribution of Family Personal Income: Methodology and Estimates for 1964*, by Edward C. Budd, Daniel B.

Radner, and John C. Hinrichs, Bureau of Economic Analysis, BEA-SP 73-21, June 1973.

3. *Population coverage.* The Bureau of the Census excluded from its sample inmates of institutions and military personnel overseas or living on post in the United States (except for a few families living on post). In addition, the income of persons who died or emigrated prior to the date of interview was not reported in the Census inquiry. The income of these groups is included in the aggregate personal income series released by the BEA.

4. *Average income.* The average income figures (e.g., for geographical regions) represent income per capita, i.e., they were derived by dividing total income by the total population including men, women, and children. Most of the Census averages, in contrast, are for households, families, unrelated individuals, or income recipients 15 years old and over.

**Department of Agriculture farm income series.** The farm income data are not directly comparable to that published by the U.S. Department of Agriculture (USDA) for several reasons. The USDA publishes two major series on income of farms: (1) net farm income and (2) net cash farm income.

For reasons listed below, the estimates of farm self-employment income per person or per family as published by the Bureau of the Census differ from estimates of operators' net farm income or net cash farm income per farm as published by the Department of Agriculture:

1. The unit of analysis in the USDA estimates is an establishment (farm) rather than a household as in the Bureau of the Census estimate.
2. The estimates of farm self-employment income as published by the Bureau of the Census and USDA's net cash income series exclude the nonmoney income items of crops grown for home consumption and an imputed rental value for farm dwellings. However, these are included in the estimates of operators' net farm income per farm.
3. The USDA estimate of net farm income includes the value of the change in inventories of commodities from the beginning to the end of the year. The USDA net cash farm income and the Bureau of the Census farm self-employment income do not.
4. The USDA series include the net income of farm operators from the rental of farms to other farmers but the census definition classifies these receipts as income other than earnings, not income from farm self-employment.
5. The USDA series is based on income from farms which are organized as proprietorships, partnerships, and corporations. The Bureau of the Census

excludes corporate farm income. (The Bureau of Economic Analysis does estimate the proportions of the USDA estimate which are earned by corporate and noncorporate farms for inclusion in the National Income and Product Account.)

The estimates of the USDA differ from the estimates of the Bureau of the Census methodologically as well as conceptually. The USDA estimates are based on data derived from the Census of Agriculture, farm surveys, business, and governmental sources, and are not available at a farm or household level, while the Bureau of the Census estimates are compiled from data collected in sample surveys. As noted later, the latter estimates are subject not only to sampling variation but also to errors of response and nonreporting.

For a more detailed discussion of the concepts and methodology used in the USDA estimates, see U.S. Department of Agriculture Handbook No. 365, Major Statistical Series of the U.S. Department of Agriculture, Vol. 3, *Gross and Net Farm Income*, September 1969.

**Federal income tax data.** For several reasons, the income data shown in this report are not directly comparable with those which may be obtained from statistical summaries of income tax returns. Income, as defined for tax purposes, differ somewhat from the concept used by the Bureau of the Census. For example, certain types of receipts, such as veterans' payments, SSI, and AFDC, are not reported on Federal tax returns. Moreover, the coverage of income tax statistics is less inclusive because many persons with low incomes are not required to file tax returns. Furthermore, some income tax returns are filed as separate returns and others as joint returns; consequently, the income reporting unit is not consistently either a family or a person.

**Old-Age, Survivors', Disability, and Health Insurance earnings record data.** Census data shown in this report and the distributions made upon the basis of Old-Age, Survivors', Disability, and Health Insurance earnings record data differ for the reasons listed below.

1. The earnings of the following groups are not covered by the earnings record data: many Federal, State, and local government employees, some employees of nonprofit organizations, workers covered by the Railroad Retirement Act, and persons who are not covered by the program because of insufficient earnings, including some farm and nonfarm self-employed persons, some farm workers, and domestic servants.
2. Employees' earnings in excess of \$51,300 per employer are not covered by the earnings record data.

3. Income other than earnings is not covered by the earnings record data.

4. The earnings record data are based upon employers' Social Security tax reports and the Federal income tax returns of self-employed persons, while the data presented in this report are obtained by household interviews.

## COMPARABILITY OF CURRENT CPS ESTIMATES WITH THOSE FROM PREVIOUS YEARS

Estimates from the CPS are in some instances not strictly comparable with those from previous years due to several factors. Among these factors are changes in (1) population controls and metropolitan residence definitions; (2) collection of income and work experience data; (3) noninterviews, nonresponses, and allocations; (4) questionnaire wording and procedures; (5) sample size and interpolation procedures; and (6) definition of the income universe. Each of these factors is discussed in the following sections, and readers should consider these differences when comparing current with previous years' estimates.

### Population Controls and Metropolitan Residence Definitions

In July 1985, the CPS began carrying the metropolitan statistical area definitions announced by the Office of Management and Budget on June 20, 1984. Figures published from the CPS in the early 1980's and throughout most of the 1970's referred to metropolitan area as defined on the basis of the 1970 census. Since there are important differences in the population classified as metropolitan using the 1970 and 1984 definitions, comparisons should be avoided.

The data for 1971 through 1990 are in some instances not entirely comparable to figures for earlier years because of revisions in the Current Population Survey. The estimates for 1979 to 1991 are based on civilian noninstitutional population established by the 1980 census. Starting in January 1972, 1970 census-based population controls, metropolitan residence definitions, and other materials were introduced into the sample and estimation procedures. The major item affecting comparability at the overall national level is the introduction of population controls based on the 1970 census. The data for 1971 through 1978 are based on civilian noninstitutional population established by the 1970 census. Figures for previous years are tied in with 1960 census-based population controls. In a number of instances, data from the March 1970 and 1971 CPS's were revised to take account of 1970 census-based population controls, thus providing some measure of the impact of the changes. (See table 3, Current Population Reports, Series P-60, No. 91.) Basically, these changes should have no substantial impact on summary measures, such as medians and means, and on proportional measures,

such as percent distributions and low-income or poverty rates. However, the changes may have more impact on the population levels in different subgroupings, such as the total number of persons or families either overall, within some particular income interval, or below the low-income level. A detailed description of these changes appears in the Bureau of Labor Statistics report, *Employment and Earnings*, Vol. 18, No. 8, February 1972.

#### **Comparability of metropolitan and nonmetropolitan data from the March 1980 CPS with data for previous years.**

Changes in the CPS design and procedures made the annual series of sample population data for metropolitan and nonmetropolitan areas inconsistent. Analytic comparisons of year-to-year changes in these figures should be avoided. Trends in metropolitan and nonmetropolitan population growth over the 1970-83 period should not be appreciably affected by the procedural changes. The major revisions to earlier CPS sample design and estimation methods have involved the varying of the number of sample units. Incorporation of approximately 10,000 supplemental housing units into the March CPS sample in 1977 was accompanied by new procedures for inflating the sample results to reflect national estimates. It was determined subsequent to the introduction of the additional sample that the new inflating (weighting) procedures used for processing both the March 1977 and March 1978 CPS supplement data had resulted in an apparent overestimate of the nonmetropolitan population and corresponding underestimate of the metropolitan population for those years. For the March 1979 CPS, another revision of the weighting process was introduced to correct the problem discovered in the earlier procedures. The result of this change was a large spurious increase in the metropolitan population and decrease in the nonmetropolitan population relative to March 1978 CPS levels.

#### **Collection of Income and Work Experience Data**

This report presents data showing income of persons and family householders with varying amounts of work experience. In the surveys from March 1966 to March 1969, civilian work experience data collected in the February and April surveys were matched with income data collected in the March survey for all households. In the surveys prior to March 1966 only persons included in the February and March surveys were matched.

Nonmatched persons included in the February and March interviews or the March and April interviews were almost always assigned work experience information from actual respondents with similar economic and demographic characteristics. Work experience values were estimated only when there was a nonmatched person with a given classification, but no respondent with similar economic and demographic characteristics.

No April or February 1969 survey record could be found for about 6 percent of the people included in the

March 1969 survey. The major reasons for these non-matches were migration, noninterviews, and coding errors. In order to eliminate the nonmatches and to improve the consistency between income and work experience data, both the income and work experience data were collected together beginning with the March 1970 survey.

The remaining persons, whose work experience data were assigned, resulted from inconsistencies between their work experience and income data and from persons who did not answer the work experience questions. It should be noted that the proportions of year-round, full-time workers shown in the Series P-60 reports differ slightly from those shown for the same subgroups in the Bureau of Labor Statistics, *Special Labor Force Reports, Work Experience of the Population*. The difference exists because the proportions are not based on exactly the same groups. The proportions presented in the *Special Labor Force Reports* relate to civilians who worked at some time during the year. In contrast, the proportions shown in the persons tables in the P-60 reports relate to civilians who received income, including not only workers but also many persons who did not work but received income from pensions, interest, dividends, or other sources aside from earnings.

#### **Noninterviews, Nonresponses, and Allocations**

In the March 1992 CPS, no interview was obtained for approximately 5.1 percent of the 60,000 households in the sample. No interview was obtained at these households during the enumeration week for reasons such as "no one home," "temporarily absent," or "refusals." In order to account for these households, the weights assigned to households in which interviews were obtained have been increased slightly. This "non-interview" adjustment procedure adjusts the weights of sample households by race of householder and within a specified set of geographical restrictions.

The nonresponse problem, which is sometimes referred to as "item nonresponse," is a serious problem in most household surveys and is especially troublesome for income. Even though an interview is obtained in many cases, complete information for all of the income questions is not available, unknown or refused. In March 1992, for example, an interview was not completed for approximately 9 percent of all income supplements. In order that the maximum amount of information can be utilized, missing income items are imputed or allocated by values which are obtained from active respondents with similar economic and demographic characteristics.

#### **Questionnaire Wording and Procedures**

**Modifications in collecting income data in the March 1979 Current Population Survey.** As part of the March 1979 CPS, the Bureau conducted an experiment in an effort to improve the reporting of income data. An

alternative questionnaire was used on three of the eight rotation groups. The experimental questionnaire used more probing questions and inquired about more detailed sources of income. The results of the experiment and its subsequent impact on the estimates are discussed in the Current Population Reports, Series P-60, No. 123, page 12. Beginning in March of 1980, this new questionnaire was used for the full CPS sample; with few modifications, this questionnaire is still in use.

### **Definition of Income Universe**

Starting in the March 1980 CPS, a decision was made to restrict the universe for presenting income data to persons 15 years old and over instead of 14 years old and over. This change was made to establish consistency between the results from the March 1980 CPS and the 1980 Census of Population. Although income data were collected for persons 14 years old and over, the income of the 14-year-olds was not used for processing and tabulation purposes.

The March 1980 CPS also incorporated the use of the "householder" concept rather than the traditional "head" concept. Under the new procedure, the householder is the first adult household member listed on the questionnaire. The instructions call for listing first the person (or one of the persons) in whose name the home is owned or rented.

Another change made in the March 1980 CPS was the exclusion of secondary families (now called unrelated subfamilies) from the count of all families. This modification was required because of the introduction of the householder concept, since unrelated subfamilies do not have a householder. For more discussion on all of these changes, see the section, "Modifications to the March 1980 CPS," Current Population Reports, Series P-60, No. 129.

### **REVISIONS TO MARCH 1989 CPS PROCESSING SYSTEM**

Between 1988 and 1989 a new computer processing system was introduced for the March Current Population Survey. This processing system rewrite was long overdue; the system in use before this year was first introduced in March 1976 and was never fully updated to reflect the numerous questionnaire changes that have

taken place since that time. In addition, the programs used to process the CPS files were written in a computer language that is being phased out of use at the Census Bureau.

Since the Census Bureau began imputing for missing income data on the CPS in 1962, there have been three major revisions to the processing system (in 1967, 1976, and 1989). Through all of these revisions, the basic strategy used to make imputations has remained the same. This approach, commonly referred to as "hot deck" imputation, assigns missing responses to sample persons with information from matched sample persons with similar demographic and economic information who answered these questions.

Under the new March processing system, there were three main modifications to the income imputation programs:

1. The edits and imputations were expanded to reflect the full detail of the March income questionnaire. The original processing system was still based on a less detailed CPS income questionnaire that has not been in use since 1980.
2. Under the revised processing procedures, entire sets of March income and noncash benefits data were imputed to supplement noninterviews from the same interviewed person. Under the original processing procedures, earnings, unearned income, and noncash benefits were imputed in separate stages during the processing system. Thus, the new processing system imputes noninterviews more efficiently and is better able to preserve the correlation between earnings, unearned income, and noncash benefits.
3. Both the old and new processing systems employ what are called "statistical matches" to link sample cases with reported data to those requiring imputation for missing responses. In the original processing system, under certain circumstances, reported data were removed and replaced with imputed data during the statistical matching process. Under the new system, reported data are never removed. This was accomplished by expanding the number of statistical matches in the income imputation system.

**Table C-1. Comparison of CPS Aggregate Money Income Concepts in 1987 With Independent Estimates of Aggregate Money Income Adjusted to CPS Money Income Concepts, by Type of Income and Reported and Imputed CPS Amounts: 1987**

Source of income	Independent source		CPS					
			Total		Reported		Imputed

All other money income .....	100.0	74.5	25.5	(X)	(X)	(X)		

<sup>1</sup>Only includes estates and trusts reported as survivor benefits. Other estates and trusts are included with rent and royalty income.

For details on the results of the revised processing procedures, see Current Population Reports, Series P-60, No. 166, *Money Income and Poverty Status in the United States: 1988*.

## QUALITY OF INCOME DATA

The quality of the income data derived from the March Current Population Survey (CPS) is affected by five main sources of error. The first, sampling errors, are errors attributable to the fact that a sample rather than a census was taken. Discussion of these errors is included in appendix D of this report. The other four main sources of error, usually termed collectively as nonsampling errors, result from 1) use of a sampling frame that does not include all units for which the survey was intended to provide data, 2) failure to contact all sample units selected, i.e., noninterview and undercoverage problems, 3) poor quality of responses, and 4) missing data problems.

Over the years evaluations of the quality of the March CPS income estimates have revealed downward biases when the survey estimates are compared to independent estimates derived from sources such as the National Income and Product Accounts (NIPA), statistics based on Federal individual income tax returns, data from the Social Security Administration (SSA), etc.

Most analyses of the magnitude of nonsampling errors in the March CPS income estimates have been made at the "aggregate" level since the kind of data needed to make such comparisons are relatively easy to obtain. Some studies have also been conducted at the "micro" level by matching the data provided by individuals with data obtained from administrative records systems for those same individuals. These studies, such as the March 1973 CPS-IRS-SSA exact match, have shown that the nonsampling error problem is much more complex than that measured at the aggregate level. For example, a significant number of respondents provide responses to the amounts of income received that appear to exceed the actual amount received. These are offset by larger errors in the other direction by a somewhat higher proportion of other respondents.

Deriving independent estimates of aggregate income for purposes of evaluating the survey data is difficult. The survey and administrative sources use different definitions, cover different universes, and are based on concepts that are not exactly the same. Therefore, adjustments to the administrative sources must be made to help correct for these inconsistencies and arrive at a valid independent estimate that can be used to make fair and accurate estimates of the quality of the survey estimates. These adjustments attempt to 1) remove income that is received by the institutional

population, the deceased, and persons not residing in the United States at the time of the interview, 2) remove any components of income that are received as "in-kind" payments or benefits, and 3) remove any lump-sum or one-time payments, withdrawals, etc.

A degree of uncertainty must be attached to the independent estimates for several reasons. First, not all of the information needed to make some of these adjustments mentioned above are available. Second, administrative sources are also subject to estimation problems resulting from the lack of adequate data, and in the case of the NIPA, periodically undergo significant revision to correct for some of these errors when more recent or more accurate information become available. Third, even though attempts are made to include income received by those operating in the legal "informal" economy in the NIPA these estimates are subject to some unknown degree of error. Fourth, no attempt is made to include estimates of income received through illegal means.

In spite of this uncertainty regarding development of independent estimates it is important to attempt to monitor the quality of the income estimates using these sources. Table C-1 contains comparisons of survey and independent estimates of aggregate income by type of income for 1987. The estimates shown in this table are not directly comparable to those for 1983, which was the last year for which independent estimates were made. Major revisions to the NIPA and some revisions in the methods for arriving at the CPS concepts make most comparisons for these years inconsistent. Because of the difficulties in deriving adequate independent estimates, the table does not cover all types of income identified in the March CPS.

Overall, the survey estimate of \$2.941 trillion was about 89 percent of the independent estimate. This result is achieved mainly because the survey estimate of wage and salary income was 99 percent of the independent estimate and this income source accounts for 75 percent of the CPS income estimate from all sources. For the other sources of income the survey estimates range from 34 percent of the independent estimate for farm income to 99 percent for Federal government and military pensions.

The apparent extreme underreporting problem for farm income helps to illustrate the difficulty in developing meaningful independent estimates. The estimate of \$46.9 billion shown in table C-1 for farm income was derived directly from the NIPA which bases its estimates on data from the United States Department of Agriculture. In contrast, farm income reported on Federal individual income tax returns for 1987 was only \$10.5 billion.

The CPS continues to have serious underreporting problems for property income (interest, dividends, net rent, and net royalty income) where the survey estimates range between 53 and 72 percent of the independent estimates.

Benefits from the means-tested programs, Aid to Families With Dependent Children (AFDC) and Supplemental Security Income (SSI) also exhibit significant survey underestimates at 73 and 83 percent of the independent estimates respectively. For these incomes, however, a significant portion of this problem is associated with misclassification of the source of income. In the CPS, AFDC benefits are often reported by survey respondents as having come from other sources of welfare payments, mainly General Assistance. Benefits from the SSI program are sometimes reported as Social Security income by respondents who do not know the true source of the benefit.

Benefits from the Veterans' Administration, unemployment compensation, and workers' compensation, all of which have a past history of significant underestimation in the March CPS, continue to have such a problem. Veterans' payments have also been shown to be subject to errors of misclassification with a significant proportion of these benefits being reported incorrectly by respondents as military retirement. The low reporting rate for workers' compensation may be in part related to significant levels of one-time, lump-sum settlements that are conceptually excluded from the survey's definition of income. Since no data are available that permit a precise adjustment to the independent estimate for the existence of lump-sum payments, this figure may be overestimated. While undoubtedly some persons incorrectly report lump-sum amounts in the survey, resulting in an error in the opposite direction, these errors are thought to be much smaller.

Pension income estimates from the survey show a peculiar pattern of underreporting problems. For Federal and military pensions the survey estimate is about 99 percent of that derived from independent sources while for private pensions and annuities the survey estimate is only about 46 percent of the independent source. The high level of reporting indicated for Federal and military retirement may be overstated somewhat because of the misreporting problem that exists between military retirement and Veteran's payments. The extremely low level of reporting for private pensions may be, in part, due to a significant overestimate of the independent estimate. Since information concerning the prevalence of lump-sum payments is not available, adequate adjustments to exclude these types of payments have not been made.

Table C-2 has been included in this report to illustrate the wide variation between income estimates based on Federal individual income tax returns and the NIPA. The NIPA estimates adjusted to survey concepts (column 4 of table C-2) were used as the basis for the calculations in table C-1. In some cases these income amounts differ significantly from those shown in the other columns of table C-2. The first

column labeled "IRS AGI as reported" represents the amounts as computed from unaudited Federal tax returns. The second column labeled "IRS AGI after TCMP adjustment" reflects adjustments made to the amounts shown in column 1 based on results of the Taxpayer Compliance Measurement Program (TCMP). This program, which performs extensive audits of a sample of tax returns every 3 years, provides estimates of the amount of income that should have been reported but was not reported for both tax filers and nonfilers that should have filed. Finally, the third column labeled "AGI after BEA reconciliation" are estimates of adjusted gross income (AGI) for Federal individual tax returns derived by adjusting the NIPA amounts to AGI concepts. This reconciliation is performed annually by the Bureau of Economic Analysis (BEA).

**Table C-2. Comparison of Independent Sources of Income for 1987**

(Billions of dollars)

Source	IRS AGI as reported	IRS AGI after TCMP adjustment	AGI after BEA reconciliation	NIPA adjusted to survey concept
Wages and salary . . . . .	2,163.9	2,239.8	2,238.9	2,215.9
Nonfarm self-employment . . . . .	105.5	276.1	210.8	219.8
Farm self-employment . . . . .	- 1.3	10.5	39.9	46.9
Interest . . . . .	<sup>1</sup> 169.0	186.4	178.7	244.4
Dividends . . . . .	66.8	75.5	100.4	73.7
Net rents and royalties . . . . .	- 7.2	6.5	23.5	40.3
Pensions and annuities . . . . .	<sup>2</sup> 124.8	147.1	164.6	125.8

<sup>1</sup>Excludes \$31.0 in tax exempt interest not in AGI.

<sup>2</sup>Excludes \$47.9 in pensions and annuities not in AGI and an unknown amount of taxable lump-sum payments.

The results of the TCMP indicate that large amounts of income are not reported on tax returns as shown by the differences in columns 1 and 2. The differences for self-employment income are especially large.

The NIPA estimates used to evaluate the quality of the survey data differ from AGI income for five main reasons. First, the NIPA estimates include the income of persons who are not required to file tax returns. Second, the NIPA estimates reflect both taxable and nontaxable income amounts. Third, the accounting methods used in the NIPA, such as the treatment of depreciation, differ from those used by the IRS. Fourth, the NIPA does not use individual income tax return data extensively in its estimation methodology because of concerns regarding high levels of misreporting. Fifth, some attempts have been made to adjust the NIPA estimates to exclude lump-sum payment, withdrawals, etc. that are sometimes included as income for tax purposes.

## Appendix D. Source and Accuracy of Estimates

### SOURCE OF DATA

Most estimates in this report come from data obtained in March of years 1968 through 1992 in the Current Population Survey (CPS). The Bureau of the Census conducts the survey every month, although this report uses only March data for its estimates. The March survey uses two sets of questions, the basic CPS and the supplement.

Some estimates in this report come from data obtained from the 1987 Panel of the Survey of Income and Program Participation (SIPP). The Bureau of the Census also conducts the SIPP every month.

**Basic CPS.** The basic CPS collects primarily labor force data about the civilian noninstitutional population. Field representatives ask questions concerning labor force participation about each member 15 years old and over in every sample household.

The present CPS sample was selected from the 1980 Decennial Census files with coverage in all 50 States and the District of Columbia. The sample is continually updated to account for new residential construction. It is located in 729 areas comprising 1,973 counties, independent cities, and minor civil divisions. About 60,000 occupied households are eligible for interview every month. Field representatives are unable to obtain interviews at about 2,600 of these units because the occupants are not home after repeated calls or are unavailable for some other reason.

Since the introduction of the CPS, the Bureau of the Census has redesigned the CPS sample several times to improve the quality and reliability of the data and to satisfy changing data needs. The most recent changes were completely implemented in July 1985.

The following table summarizes changes in the CPS designs for the years for which data appear in this report.

### Description of the March Current Population Survey

Time period	Number of sample areas	Housing units eligible <sup>1</sup>	
		Interviewed	Not interviewed
1990 to 1992 .....	729	57,400	2,600
1989 .....	729	53,600	2,500
1986 to 1988 .....	729	57,000	2,500
1985 .....	629/729 <sup>2</sup>	57,000	2,500
1982 to 1984 .....	629	59,000	2,500
1990 to 1981 .....	629	65,500	3,000
1977 to 1979 .....	614	55,000	3,000
1973 to 1976 .....	461	46,500	2,500
1972 .....	449	45,000	2,000
1967 to 1971 .....	449	46,000	2,000

<sup>1</sup>Excludes about 2,500 Hispanic households added from the previous November sample. (See "CPS March Supplement.")

<sup>2</sup>The CPS was redesigned following the 1980 Decennial Census of Population and Housing. During phase-in of the new design, housing units from the new and old designs were in the sample.

**CPS March Supplement.** In addition to the basic CPS questions, field representatives asked supplementary questions in March about money income received the previous calendar year.

To obtain more reliable data for the Hispanic-origin population, the March CPS sample was increased by about 2,500 eligible housing units, interviewed the previous November, that contained at least one sample person of Hispanic origin. In addition, the sample included persons in the Armed Forces living off post or with their families on post.

**CPS Estimation Procedure.** This survey's estimation procedure inflates weighted sample results to independent estimates of the civilian noninstitutional population of the United States by age, sex, race and Hispanic/non-Hispanic categories. The independent estimates were

based on statistics from decennial censuses of population; statistics on births, deaths, immigration and emigration; and statistics on the size of the Armed Forces. The independent population estimates used for 1981 (1980 for income estimates) to present were based on updates to controls established by the 1980 Decennial Census. Data previous to 1981 were based on independent population estimates from the most recent decennial census. For more details on the change in independent estimates, see the section entitled "Introduction of 1980 Census Population Controls" in an earlier report (Series P-60, No. 133). The estimation procedure for the March supplement included a further adjustment so husband and wife of a household received the same weight.

The estimates in this report for 1983 (from March 1984 CPS) and later also employ a revised survey weighting procedure for persons of Hispanic origin. In previous years, weighted sample results were inflated to independent estimates of the noninstitutional population by age, sex, and race. There was no specific control of the survey estimates for the Hispanic population. Since then, the Bureau of the Census developed independent population controls for the Hispanic population by sex and detailed age groups. Revised weighting procedures incorporate these new controls. The independent population estimates include some, but not all, undocumented immigrants.

**Basic SIPP.** The sample from the SIPP, 1987 panel, is located in 230 Primary Sampling Units (PSU's) each consisting of a county or a group of contiguous counties. Within these PSU's, expected clusters of two housing units (HU's) were systematically selected from lists of addresses prepared for the 1980 Decennial Census to form the bulk of the sample. Similar to CPS, the SIPP sample is continually updated to account for HU's built after the 1980 census.

The period covered by the SIPP 1987 longitudinal panel consists of 28 interview months (seven interviews) conducted from February 1987 to May 1989. The first interview was conducted during February, March, April, and May of 1987. Each sample person was visited every 4 months thereafter. At each interview the reference period was the four months preceding the interview month. In general, one cycle of four interviews covering the entire sample, using the same questionnaire is called a wave. For subsequent interviews, only original sample persons (those in Wave 1 sample households and interviewed in Wave 1) and persons living with them were eligible to be interviewed. Original sample persons were followed if they moved to a new address, unless the new address was more than 100 miles from a SIPP sample area. Then, telephone interviews were attempted. All first wave noninterviewed

households were automatically designated as noninterviews for all subsequent interviews. When original sample persons moved to remote parts of the country and couldn't be reached by telephoning, moved without leaving a forwarding address, or refused to be interviewed, additional noninterviews resulted.

Approximately 33,100 persons were initially eligible to be interviewed; 24,400 were classified as interviewed for the life of the panel. The person nonresponse rate was 26 percent.

**SIPP Estimation Procedure.** Several stages of weight adjustments were involved in the estimation procedure used to derive the SIPP longitudinal person weights. Each person received a base weight equal to the inverse of the probability of selection. Two noninterview adjustment factors were applied. One adjusted the weights of interviewed persons in interviewed households to account for households which were eligible for the sample but could not be interviewed at the first interview. The second was applied to compensate for person noninterviews occurring in subsequent interviews. The Bureau has used complex techniques to adjust the weights for nonresponse, but the success of these techniques in avoiding bias is unknown.

Another factor was applied to each interviewed person's weight to account for the SIPP sample areas not having the same population distribution as the strata from which they were selected.

An additional stage of adjustment to longitudinal person weights was performed to reduce the mean square error of the survey estimates. This was accomplished by ratio adjusting the sample estimates to agree with Current Population Survey (CPS) type estimates of the civilian (and some military) noninstitutional population of the United States by demographic characteristics including age, sex, and race, as of the specified control date. For the 1987 Panel, the control date is March 1, 1987. The CPS estimates by age, race, and sex, were brought into agreement with estimates from the 1980 Decennial Census which have been adjusted to reflect births, deaths, immigration, emigration, and changes in the Armed Forces since 1980. Also, SIPP estimates were controlled to independent Hispanic controls.

## ACCURACY OF ESTIMATES

Since the CPS and SIPP estimates come from a sample, they may differ from figures from a complete census using the same questionnaires, instructions, and enumerators. A sample survey estimate has two possible types of error: nonsampling and sampling. The accuracy of an estimate depends on both types of error, but the full extent of the nonsampling error is unknown. Consequently, one should be particularly careful when interpreting results based on a relatively small number

of cases or on small differences between estimates. The standard errors for CPS and SIPP estimates primarily indicate the magnitude of sampling error. They also partially measure the effect of some nonsampling errors in responses and enumeration, but do not measure systematic biases in the data. (Bias is the average over all possible samples of the differences between the sample estimates and the desired value.)

**Nonsampling Variability.** Nonsampling errors can be attributed to several sources including the following:

- Inability to obtain information about all cases in the sample.
- Definitional difficulties.
- Differences in the interpretation of questions.
- Respondents' inability or unwillingness to provide correct information.
- Respondents' inability to recall information.
- Errors made in data collection such as in recording or coding the data.
- Errors made in processing the data.
- Errors made in estimating values for missing data.
- Failure to represent all units with the sample (undercoverage).

CPS and SIPP undercoverage results from missed housing units and missed persons within sample households. Compared to the level of the 1980 Decennial Census, overall CPS and SIPP undercoverage is about 7 percent. Undercoverage varies with age, sex, and race. Generally, undercoverage is larger for males than for females and larger for Blacks and other races combined than for Whites. As described previously, ratio estimation to independent age-sex-race-Hispanic population controls partially corrects for the bias due to undercoverage. However, biases exist in the estimates to the extent that missed persons in missed households or missed persons in interviewed households have different characteristics from those of interviewed persons in the same age-sex-race-Hispanic group. Furthermore, the independent population controls have not been adjusted for undercoverage in the 1980 census.

Answers to questions about money income often depend on the memory or knowledge of one person in a household. Recall problems can cause underestimates of income in survey data, because it is easy to forget minor or irregular sources of income. Respondents may also misunderstand what the Census Bureau considers money income, or may simply be unwilling to answer these questions correctly because the questions are considered too personal. See Appendix C, "Quality of Income Data," for more discussion.

For additional information on nonsampling error including the possible impact on CPS data when known, refer to Statistical Policy Working Paper 3, *An Error Profile: Employment as Measured by the Current Population Survey*, Office of Federal Statistical Policy and Standards, U.S. Department of Commerce, 1978 and Technical Paper 40, *The Current Population Survey: Design and Methodology*, Bureau of the Census, U.S. Department of Commerce.

For additional information on nonsampling error found in the SIPP data, refer to the *Quality Profile for the Survey of Income and Program Participation*, SIPP Working Paper #8708, Bureau of the Census, July 1987.

**Comparability of Data.** Data obtained from the CPS, SIPP, and other sources are not entirely comparable. This results from differences in field representative training and experience and in differing survey processes. This is an example of nonsampling variability not reflected in the standard errors. Use caution when comparing results from different sources.

Caution should also be used when comparing CPS estimates in this report, which reflect 1980 census-based population controls, with estimates for 1979 (from March 1980 CPS) and earlier years, which reflect 1970 census-based population controls. This change in population controls had relatively little impact on summary measures such as means, medians, and percentage distributions, but did have a significant impact on levels. For example, use of 1980-based population controls results in about a 2-percent increase in the civilian noninstitutional population and in the number of families and households. Thus, estimates of levels for data collected in 1981 and later years will differ from those for earlier years by more than what could be attributed to actual changes in the population. These differences could be disproportionately greater for certain subpopulation groups than for the total population.

Since no independent population control totals for persons of Hispanic origin were used before 1983, compare Hispanic estimates over time cautiously.

A number of changes were made in data collection and estimation procedures beginning with the March 1980 CPS. The major changes were the use of a more detailed income questionnaire, the use of the "householder" concept, the introduction of the new farm definition, and use of more detailed income intervals in the upper range of the income distribution. Due to these and other changes, one should use caution when comparing estimates for 1979 through 1991 with estimates for earlier years. A description of these changes and the effect they had on the data is given in the section "Modifications to the March 1980 CPS" of an earlier report (Series P-60, No. 129).

Another major change is that CPS income estimates for 1985 are the first based entirely on households

selected from the 1980 census-based sample design. Estimates by type of residence category such as metropolitan, nonmetropolitan, farm and nonfarm, which were omitted from the 1984 report because of the mixed 1970 and 1980 census sampling frame used for the March 1985 CPS, have been resumed. The residence categories reflect metropolitan areas defined as of June 1984. In addition, the March 1986 CPS supplement questionnaire was revised to enable the coding of higher amounts of earnings from longest job.

**Note When Using Small Estimates.** Summary measures (such as medians and percentage distributions) are shown only when the base is 75,000 or greater for CPS; 200,000 or greater for SIPP. Because of the large standard errors involved, summary measures would probably not reveal useful information when computed on a smaller base. However, estimated numbers are shown even though the relative standard errors of these numbers are larger than those for corresponding percentages. These smaller estimates permit combinations of the categories to suit data users' needs. Take care in the interpretation of small differences. For instance, even a small amount of nonsampling error can cause a borderline difference to appear significant or not, thus distorting a seemingly valid hypothesis test.

**Estimation of Median Incomes.** The methodology for computing median income has been changed over the past few years. The computations have been done using either Pareto interpolation or linear interpolation. Currently, linear interpolation is used to estimate all medians. Pareto interpolation assumes a decreasing density of population within an income interval, whereas linear interpolation assumes a constant density of population within an income interval. Estimates of median income for 1979 through 1987 and associated standard errors have been calculated using Pareto interpolation if the estimate is larger than \$20,000 for persons or \$40,000 for families and households. This is because the width of the income interval containing the estimate is greater than \$2,500. Estimates of median income for 1976, 1977, and 1978 and associated standard errors were calculated using Pareto interpolation if the estimate was larger than \$12,000 for persons or \$18,000 for families and households. This is because the width of the income interval containing the estimate is greater than \$1,000. All other estimates of median income and associated standard errors for 1976 through 1991 and almost all of the estimates of median income and associated standard errors for 1975 and earlier were calculated using linear interpolation. Thus, use caution when comparing median incomes above \$12,000 for persons or \$18,000 for families and households for different years. Median incomes below those levels are more comparable from year to year since they have always been calculated using linear interpolation. For an

indication of the comparability of medians calculated using Pareto interpolation with medians calculated using linear interpolation, see Series P-80, No. 114, *Money Income in 1976 of Families and Persons in the United States*.

**Sampling Variability.** Sampling variability is variation that occurred by chance because a sample was surveyed rather than the entire population. Standard errors, as calculated by methods described in "Standard Errors and Their Use," are primarily measures of sampling variability, although they may include some nonsampling error.

**Standard Errors and Their Use.** A number of approximations are required to derive, at a moderate cost, standard errors applicable to all the estimates in this report. Instead of providing an individual standard error for each estimate, generalized sets of standard errors are provided for various types of characteristics.

Tables D-1 and D-2 provide CPS standard errors of estimated numbers and estimated percentages, respectively. The standard errors in both tables are of persons, households, families, and unrelated individuals for Total or White, Black, and Hispanic. For Asian and Pacific Islanders, use the standard errors for Total or White from these two tables. Table D-3 has CPS standard error parameters for various types of characteristics. Table D-4 provides factors to approximate CPS standard errors for estimates prior to 1991. Table D-5 provides CPS Hispanic parameters for estimates prior to 1984. Table D-6 provides CPS Asian and Pacific Islander parameters for income and nonincome characteristics. Table D-7 has the year-to-year CPS correlation coefficients for income characteristics.

Table D-8 and D-9 provide SIPP standard errors of estimated numbers and percentages, respectively. Table D-10 has SIPP standard error parameters by race and sex.

The sample estimate and its standard error enable one to construct a confidence interval, a range that would include the average result of all possible samples with a known probability. For example, if all possible samples were surveyed under essentially the same general conditions and using the same sample design, and if an estimate and its standard error were calculated from each sample, then approximately 90 percent of the intervals from 1.645 standard errors below the estimate to 1.645 standard errors above the estimate would include the average result of all possible samples.

A particular confidence interval may or may not contain the average estimate derived from all possible samples. However, one can say with specified confidence that the interval includes the average estimate calculated from all possible samples.

Some statements in the report may contain estimates followed by a number in parentheses. This number can be added to and subtracted from the estimate to

calculate upper and lower bounds of the 90-percent confidence interval. For example, if a statement contains the phrase "grew by 1.7 ( $\pm 1.0$ ) percent," the 90-percent confidence interval for the estimate, 1.7 percent, is 0.7 percent to 2.7 percent.

Standard errors may also be used to perform hypothesis testing, a procedure for distinguishing between population parameters using sample estimates. The most common type of hypothesis appearing in this report is that the population parameters are different. An example of this would be comparing the median annual income of Black families to the median annual income of White families.

Tests may be performed at various levels of significance, where a significance level is the probability of concluding that the characteristics are different when, in fact, they are the same. All statements of comparison in the text have passed a hypothesis test at the 0.10 level of significance or better. This means that the absolute value of the estimated difference between characteristics is greater than or equal to 1.645 times the standard error of the difference.

**Table D-1. CPS Standard Errors of Estimated Numbers**

(Numbers in thousands)

Size of estimate	Persons			Households, families, and unrelated individuals		
	Total or White	Black	Hispanic	Total or White	Black	Hispanic
75 .....	13	14	14	12	13	13
100 .....	15	16	16	14	15	15
250 .....	24	25	25	23	24	23
500 .....	34	35	35	32	33	33
1,000 .....	47	50	49	45	46	45
3,000 .....	82	81	78	78	76	72
5,000 .....	105	99	91	100	92	83

(X) Not applicable

Note: See table D-3 or D-6 for the appropriate factor to apply to the above standard errors. For Asian and Pacific Islanders, use the standard errors for Total or White

**Standard Errors of Estimated Numbers.** There are two ways to compute the approximate standard error,  $s_x$ , of an estimated number shown in this report. The first uses the formula

$$s_x = fs \tag{1}$$

where  $f$  is a factor from table D-3, D-6, or D-10 and  $s$  is the standard error of the estimate obtained by interpolation from table D-1 or D-8. The second method uses formula (2), from which the standard errors in table D-1 and D-8 were calculated. This formula will provide more accurate results than formula (1).

$$s_x = \sqrt{ax^2 + bx} \tag{2}$$

Here  $x$  is the size of the estimate and  $a$  and  $b$  are the parameters in table D-3, D-6, or D-10 associated with the particular type of characteristic. When calculating standard errors for numbers from cross-tabulations involving different characteristics, use the factor or set of parameters for the characteristic which will give the largest standard error.

**Illustration**

Table 1 shows that there were 67,173,000 family households in 1992. Using formula (1) with  $f = 1.0$  from table D-3 and  $s = 278,000$  interpolating from table D-1, the approximate standard error of 67,173,000 is

$$s_x = (1.0)(278,000) = 278,000$$

Alternatively, using formula (2) with  $a = -0.000012$  and  $b = 1,899$  from table D-3, the approximate standard error of 67,173,000 is

$$s_x = \sqrt{(-0.000012)(67,173,000)^2 + (1,899)(67,173,000)} = 271,000$$

The 90-percent confidence interval for the estimated number of family households in 1992 is from 66,727,000 to 67,619,000, i.e.,  $67,173,000 \pm 1.645(271,000)$ .

**Standard Errors of Estimated Percentages.** The reliability of an estimated percentage, computed using sample data for both numerator and denominator, depends on the size of the percentage and its base. Estimated percentages are relatively more reliable than the corresponding estimates of the numerators of the percentages, particularly if the percentages are 50 percent or more. When the numerator and denominator of the percentage are in different categories, use the factor or parameter from table D-3, D-6, or D-10 indicated by the numerator.

The approximate standard error,  $s_{x,p}$ , of an estimated percentage can be obtained by use of the formula

$$s_{x,p} = fs \tag{3}$$

In this formula,  $f$  is the appropriate factor from table D-3, D-6, or D-10 and  $s$  is the standard error of the estimate obtained by interpolation from table D-2 or D-9.

Table D-2. CPS Standard Errors of Estimated Percentages

15,000.....	0.18	0.3	0.4	0.6	0.7	0.17	0.3	0.4	0.5	0.6

Note: See table D-3 or D-6 for the appropriate factor to apply to the above standard errors. For Asian and Pacific Islanders, use the standard errors for Total or White.

Alternatively, formula (4) will provide more accurate results:

$$s_{x,p} = \sqrt{\frac{b}{x} p(100 - p)} \quad (4)$$

Here  $x$  is the total number of persons, families, households, or unrelated individuals which is the base of the percentage,  $p$  is the percentage ( $0 \leq p \leq 100$ ), and  $b$  is the parameter in table D-3, D-6, or D-10 associated with the characteristic in the numerator of the percentage.

### Illustration

Table 1 shows that 11,692,000 or 17.4 percent of the 67,173,000 family households were maintained by female householders with no husband present. Using formula (3) with  $f = 1.0$  from table D-3 and  $s = 0.2$  interpolating from table D-2, the approximate standard error of 17.4 percent is

$$s_{x,p} = (1.0)(0.2) = 0.2$$

Alternatively, using formula (4) with  $b = 1,899$  from table D-3, the approximate standard error of 17.4 percent is

$$s_{x,p} = \sqrt{\frac{1,899}{67,173,000} (17.4) (100.0 - 17.4)} = 0.2$$

The 90-percent confidence interval for the estimated percentage of family households that were maintained by female householders with no husband present is from 17.1 percent to 17.7 percent, i.e.,  $17.4 \pm 1.645(0.2)$ .

**Standard Error of a Difference.** The standard error of the difference between two sample estimates is approximately equal to

$$s_{x-y} = \sqrt{s_x^2 + s_y^2 - 2rs_x s_y} \quad (5)$$

where  $s_x$  and  $s_y$  are the standard errors of the estimates,  $x$  and  $y$ . The estimates can be numbers, percentages, ratios, etc. The correlation coefficient,  $r$ , can be determined from table D-6 for year-to-year comparisons for CPS income estimates of numbers and proportions; for other comparisons and for SIPP assume that  $r$  equals zero. This will represent the actual standard error quite accurately for the difference between estimates of the same characteristic in two different areas, or for the difference between separate and uncorrelated characteristics in the same area. However, if there is a high positive (negative) correlation between the two characteristics, the formula will overestimate (underestimate) the true standard error.

### Illustration

Table 24 shows that the median income of all males in 1991,  $x$ , was \$20,469 and the median income of all

Notes: To estimate standard errors prior to 1991, multiply by the appropriate factor in table D-4. For regional estimates multiply the a and b parameters by 0.74, 0.96, 1.04 and 1.06 for Northeast, Midwest, South and West, respectively.

The a and b parameters should be multiplied by 1.5 for nonmetropolitan residence categories.

females in 1991, y, was \$10,476. The apparent difference between the median income of males and females in 1991 is \$9,993. Table 24 also shows the approximate standard errors,  $s_x$  and  $s_y$ , are \$105 and \$69, respectively. Using formula (5) with  $r = 0$ , the approximate standard error of \$9,993 is

$$s_{x-y} = \sqrt{(105)^2 + (69)^2} = 126$$

The 90-percent confidence interval for the estimated difference between the median income of males and females in 1991 is from \$9,786 to \$10,200, i.e.,  $\$9,993 \pm 1.645(\$126)$ . Because this interval does not contain zero, we can conclude with 90-percent confidence that the median income of males in 1991 was larger than the median income of females in 1991.

**Standard Error of a Median.** The sampling variability of an estimated median depends on the form of the distribution and the size of the base. One can approximate the reliability of an estimated median by determining a confidence interval about it. (See the section "Standard Errors and Their Use" for a general discussion of confidence intervals.)

Estimate the 68-percent confidence limits of a median based on sample data using the following procedure.

1. Determine, using formula (4), the standard error of the estimate of 50 percent from the distribution.
2. Add to and subtract from 50 percent the standard error determined in step 1.
3. Using the distribution of the characteristic, determine upper and lower limits of the 68-percent confidence interval by calculating values corresponding to the two points established in step 2.

Use Pareto interpolation for any point in an income interval greater than \$2,500 in width, and linear interpolation otherwise. The formulas for interpolation are:

$$\text{Pareto: } X_{pN} = \exp \left[ \frac{\ln(pN/N_1)}{\ln(N_2/N_1)} \ln(A_2/A_1) \right] A_1 \quad (6)$$

$$\text{Linear: } X_{pN} = \frac{pN - N_1}{N_2 - N_1} (A_2 - A_1) + A_1 \quad (7)$$

where

$X_{pN}$  = estimated upper and lower bounds for the confidence interval ( $0 \leq p \leq 1$ ). For purposes of calculating the confidence interval, p takes on the values

determined in step 2. Note that  $X_{pN}$  estimates the median when  $p = 0.50$ .

$N$  = for distribution of numbers: the total number of units (persons, households, etc.) for the characteristic in the distribution.

= for distribution of percentages: the value 1.0.

$p$  = the values obtained in step 2.

$A_1, A_2$  = the lower and upper bounds, respectively, of the interval containing  $X_{pN}$ .

$N_1, N_2$  = for distribution of numbers: the estimated number of units (persons, households, etc.) with values of the characteristic greater than or equal to  $A_1$  and  $A_2$ , respectively.

= for distribution of percentages: the estimated percentage of units (persons, households, etc.) having values of the characteristic greater than or equal to  $A_1$  and  $A_2$ , respectively.

exp is the exponential function.

Ln is the natural logarithm function.

A mathematically equivalent result is obtained by using common logarithms (base 10) and antilogarithms.

4. Divide the difference between the two points determined in step 3 by two to obtain the standard error of the median.

Use of the above procedure could result in standard errors which differ from those given in the detailed tables. The reasons for this discrepancy are the use of a more detailed distribution than that given in the tables in determining the published standard errors, and the rounding of the numbers to thousands in the published tables. Linear interpolation was almost always used to compute the published medians and standard errors. Occasionally, a median may lie in an open-ended interval. To calculate its standard error the user must call Housing and Household Economic Statistics Division of the Census Bureau to obtain the methodology.

**Illustration**

Table 31 shows that the median earnings for male workers was \$21,857 in 1991. Table 31 also shows that the size, or base, of the distribution from which this median was determined was 72,040,000 male workers.

1. Using formula (4) with  $b = 2,254$  from table D-3, the standard error of 50 percent on a base of 72,040,000 is about 0.3 percent.

2. To obtain a 68-percent confidence interval on the estimated median, add to and subtract from 50 percent the standard error found in step 1. This yields percentage limits of 49.7 and 50.3.

3. The lower and upper limits for the interval in which the median falls are \$20,000 and \$22,500, respectively (from table 31). The estimated numbers of male workers with an income greater than or equal to \$20,000 and \$22,500 are 39,432,000 and 34,839,000, respectively. Using formula (7), the lower limit for the confidence interval of the median is

$$\frac{(.503)(72,040,000) - 39,432,000}{34,839,000 - 39,432,000}(22,500 - 20,000) + 20,000 = 21,740$$

Similarly, the upper limit is approximately

$$\frac{(.497)(72,040,000) - 39,432,000}{34,839,000 - 39,432,000}(22,500 - 20,000) + 20,000 = 21,975$$

Thus, a 68-percent confidence interval for the median income for male workers is from \$21,740 to \$21,975.

4. Therefore, the standard error of the median is

$$\frac{(21,975 - 21,740)}{2} = 118$$

**Table D-4. CPS Factors to Apply to a and b Parameters for Estimates Prior to 1991**

**Standard Error of a Mean for Grouped Data.** The formula used to estimate the standard error of a mean for grouped data is

$$s_{\bar{x}} = \sqrt{(b/y)S^2} \tag{8}$$

In this formula,  $y$  is the size of the base of the distribution and  $b$  is a parameter from table D-3, D-6, or D-10. The variance,  $S^2$ , is given by the following formula:

$$S^2 = \sum_{i=1}^c p_i \bar{x}_i^2 - \bar{x}^2 \tag{9}$$

where  $\bar{x}$ , the mean of the distribution, is estimated by

$$\bar{x} = \sum_{i=1}^c p_i \bar{x}_i \tag{10}$$

230,000.....	0.1	0.2	0.3	0.4	0.6	0.6
250,000.....	0.1	0.2	0.3	0.4	0.5	0.6

Otherwise, the approximate average value for an open-ended interval is

$$\bar{x}_c = \frac{3}{2} z_{c-1} \quad (11)$$

**Standard Error of a Ratio.** Certain estimates may be calculated as the ratio of two numbers. The standard error of a ratio,  $x/y$ , may be computed using

$$s_{x/y} = \frac{x}{y} \sqrt{\left[\frac{s_x}{x}\right]^2 + \left[\frac{s_y}{y}\right]^2 - 2r\frac{s_x s_y}{xy}} \quad (12)$$

In formula (12),  $r$  represents the correlation between the numerator and the denominator of the estimate.

For one type of ratio, the denominator is a count of families or households and the numerator is a count of persons in those families or households with a certain

characteristic. If there is at least one person with the characteristic in every family or household, use 0.7 as an estimate of  $r$ . An example of this type is the mean number of children per family with children.

For all other types of ratios,  $r$  is assumed to be zero. If  $r$  is actually positive (negative), then this procedure will provide an overestimate (underestimate) of the standard error of the ratio. Examples of this type are the mean number of children per family and the family poverty rate.

NOTE: For estimates expressed as the ratio of  $x$  per 100  $y$  or  $x$  per 1,000  $y$ , multiply formula (12) by 100 or 1,000, respectively, to obtain the standard error.

**Illustration**

Table 24 shows the median earnings for year-round, full-time female workers in 1991,  $x$ , was \$20,553 and the

**Table D-10. SIPP Generalized Variance Parameters for Estimates Using Panel Weights - 1987 Longitudinal Panel File**

Characteristics	a	b	f
<b>PERSONS</b>			
Total or White			
Both Sexes .....	-0.0001654	38,147	1.00
Male .....	-0.0003421	38,147	1.00
Female .....	-0.0003203	38,147	1.00
Black			
Both Sexes .....	-0.0005115	14,113	0.61
Male .....	-0.0010991	14,113	0.61
Female .....	-0.0009565	14,113	0.61

median earnings for year-round, full-time male workers in 1991,  $y$ , was \$29,421. The ratio of the median earnings is 0.70. Table 24 also shows the approximate standard errors,  $s_x$  and  $s_y$ , are \$97 and \$221, respectively. Using formula (12) with  $r = 0$ , the approximate standard error of 0.70 is

$$S_{x/y} = \frac{20,553}{29,421} \sqrt{\left[\frac{97}{20,553}\right]^2 + \left[\frac{221}{29,421}\right]^2} = 0.01$$

The 90-percent confidence interval for the ratio of the median earnings for year-round, full-time female workers to the median earnings for year-round, full-time male workers is from 0.68 to 0.72, i.e.,  $0.70 \pm 1.645(0.01)$ .

**18. LINE NUMBER**

**19. What was ... doing most of LAST WEEK -**

Working  Keeping house  Going to school  or something else?

Working (Ship to 20A) ... WK   
 With a job but not at work ... J   
 Looking for work ... LK   
 Keeping house ... H   
 Going to school ... S   
 Unable to work (Ship to 24) ... U   
 Retired ... R   
 Other (Specify) ... OT

**20. Did ... do any work at all LAST WEEK, not counting work around the house?** (Note: If farm or business operator in hh, ask about unpaid work.)

Yes  No  (Go to 21)

**20A. How many hours did ... work LAST WEEK at all jobs?**

0 0  
1 1  
2 2  
3 3  
4 4  
5 5  
6 6  
7 7  
8 8  
9 9

**20B. CHECK ITEM**

40  (Ship to Item 23)  
1-34  (Go to 20C)

**20C. Did ... lose any time or take any time off LAST WEEK for any reason such as illness, holiday or slack work?**

Yes  No  How many hours did ... take off?

(Correct 20A if lost time not already deducted; if 20A reduced below 35, correct 20B and fill 20C)

No  7

**20D. Did ... work any overtime or at more than one job LAST WEEK?**

Yes  No  How many extra hours did ... work?

(Correct 20A and 20B as necessary if extra hours not already included and ship to 23.)

No   (Ship to 23)

**21. (If in 19, ship to 21A.)** Did ... have a job or business from which he/she was temporarily absent or on layoff LAST WEEK?

Yes  No  (Go to 22)

**21A. Why was ... absent from work LAST WEEK?**

Own illness ...   
 On vacation ...   
 Bad weather ...   
 Labor dispute ...   
 New job to begin within 30 days  (Ship to 22B and 22C)  
 Temporary layoff (Under 30 days)   
 Indefinite layoff (30 days or more or no def. recall data)  (Ship to 22C)  
 Other (Specify) ...

**21B. Is ... receiving wages or salary from his/her employer for any of the time off LAST WEEK?**

Yes  No

**21C. Does ... usually work 35 hours or more a week at this job?**

Yes  No

(Ship to 23 and enter job held last week)

**22. (If LK in 19, ship to 22A.)** Has ... been looking for work during the past 4 weeks?

Yes  No  (Go to 24)

**22A. What has ... been doing in the last 4 weeks to find work? (Mark all methods used; do not read list.)**

Checked pub. employ. agency with-  
 - pvt. employ. agency   
 - employer directly   
 - friends or relatives   
 - placed or answered ads   
 - Nothing (Ship to 24)   
 - Other (Specify in notes, e.g., ITPA, union or post-graduate, etc.)

**22B. At the time ... started looking for work, was it because he/she lost or quit a job or was there some other reason?**

Lost job   
 Quit job   
 Left school   
 Wanted temporary work   
 Change in home or family responsibilities   
 Left military service   
 Other (Specify in notes)

**22C. 1) How many weeks has ... been looking for work?**

1 1  
2 2  
3 3  
4 4  
5 5  
6 6  
7 7  
8 8  
9 9

**2) How many weeks ago did ... start looking for work?**

3) How many weeks ago was ... laid off?

**22D. Has ... been looking for full-time or part-time work?**

Full  Part

**22E. Could ... have taken a job LAST WEEK if one had been offered?**

Yes  No  Why not?

Already has a job   
 Temporary illness   
 Going to school   
 Other (Specify in notes)

**22F. When did ... last work at a full-time job or business lasting 2 consecutive weeks or more? Within last 12 months (Specify) ...**

(Month) \_\_\_\_\_

One to five years ago   
 More than 5 years ago   
 Never worked full-time 2 wks. or more   
 Never worked at all   
 (SHIP to 23. If layoff entered in 21A, enter job, either full or part time, from which laid off. Also enter last full time job lasting 2 weeks or more, or "never worked.")

**23. DESCRIPTION OF JOB OR BUSINESS**

**23A. For whom did ... work? (Name of company, business, organization or other employer.)**

**23B. What kind of business or industry is this? (For example: TV and radio mfg., retail shoe store, State Labor Dept.)**

**23C. What kind of work was ... doing? (For example: electrical engineer, stock clerk, typist, farmer.)**

**23D. What were ...'s most important activities or duties at this job? (For example: types, keeps account books, fills, sells cars, operates printing press, finishes concrete.)**

**23E. Was this person**

An employee of a PRIVATE Co. but, or individual for wages, salary or comm. ... P   
 A FEDERAL government employee ... F  (Go to 25F)  
 A STATE government employee ... S   
 A LOCAL government employee ... L   
 Self-empl. in OWN bus., prof. practice, or farm   
 Is the business incorporated? { Yes ... I   
 No ... SE  (Ship to 26)  
 Working WITHOUT PAY in fam. bus. or farm ... WP   
 NEVER WORKED ... NEV

**23F. CHECK ITEM**

Entry for MA in item 20A  (Go to 25 at top of page)  
 Entry for MA in item 21B   
 All other cases  (Ship to 26)

**25. CHECK ITEM** (Rotation number)

First digit of BSGMENT number is:  
 0 2, 3, 4, 6, 7 or 8 (Ship to 26)  
 1 or 5 (Go to 24A)

**25A. How many hours per work week ...**

0 0  
1 1  
2 2  
3 3  
4 4  
5 5  
6 6  
7 7  
8 8  
9 9

**25B. Is ... paid by the hour on this job?**

Yes  No  (Go to 25C)

**25C. How much Dollars Cents**

per hour?

**25D. Does ... want a regular job now, either full- or part-time?**

Yes  No  (Ship to 24E)

**25E. How much does ... usually earn per work week at this job BEFORE deductions? Includes any overtime pay, commissions, or tips usually received.**

Dollars  Cents

REF

**25F. On this job, is ... a member of a labor union or of an employee association similar to a union?**

Yes  No  (Ship to 26)

**25G. On this job, is ... covered by a union or employee association contract?**

Yes  No  (Go to 26)

**26. CHECK ITEM** (Rotation number)

First digit of BSGMENT number is:  
 0 2, 3, 4, 6, 7 or 8 (Ship to 26)  
 1 or 5 (Go to 24A)

**26A. When did ... last work for pay at a regular job or business, either full- or part-time?**

Within past 12 months   
 1 up to 2 years ago  (Go to 24B)  
 2 up to 3 years ago   
 3 up to 4 years ago   
 4 up to 5 years ago   
 5 or more years ago  (Ship to 24C)  
 Never worked

**26B. Why did ... leave that job?**

Personal, family (incl. pregnancy) or school   
 Health   
 Retirement or old age   
 Seasonal job completed   
 Slack work or business conditions   
 Temporary nonseasonal job completed   
 Unsatisfactory work arrangements (Hours, pay, etc.)   
 Other

**26C. What are the reasons ... is not looking for work? (Mark each reason mentioned)**

Business no work available in line of work or area   
 Couldn't find any work   
 Lack of training, working skills or experience   
 Employers think too young or too old   
 Other  (Specify in notes)  
 Can't arrange child care   
 Family responsibilities   
 In school or other training   
 Ill health, physical disability   
 Other (Specify in notes)   
 Don't know

**26D. Has ... looked to look for work of any kind in the next 12 months?**

Yes  No  (Ship to 24E)  
 It depends (Specify in notes)   
 Don't know

**FOLLOW-UP INFORMATION - TRANSCRIBE THIS INFORMATION FROM THE CPS-1 AND CONTROL CARD BEFORE SENDING THEM TO THE RO.**

**ALL CPS-1s AND CONTROL CARDS MUST BE SENT TO THE R.O. BY SATURDAY, MARCH 21**

**ALL 688s MUST BE MAILED TO R.O. BY SATURDAY, MARCH 26**

- (1) Complete items 3, 6-8, 77, 79, 82 and 84 on page 1.
- (2) Complete items 18A, 18B, 18D, and 18G1 for each 16+ person, (p. 3, 4, 5, 6).
- (3) Record below the industry and occupation description from CPS-1 items 23A-23E as applicable. You will need to refer to it when filling item 46 in your followup interview.
- (4) Complete items 58D and 58, (p. 7 and 8, respectively).
- (5) Note below Names and Line No.'s of persons (and item numbers, if necessary) needing followup. Also, as necessary note address, telephone, and 'best time to call' information from control card.

**NOTES:**

Area with horizontal dashed lines for notes.

**CIVILIAN 15+ AND CURRENT ARMED FORCES MEMBER, BEGIN WITH ITEM 29A**
