

AXOMETER

M615A  
Axometer

THE Axometer was designed solely for locating the axis of all spherocylinders and plain cylinders in any form. It does this instantly, accurately, and electrically.

Simply rotate the target until the three small images fuse into one. The reading is then taken directly from the axis dial with results that are unusually accurate.

The Axometer can be used on the workbench, fitting table, or in the adjusting room.

It is finely constructed of metal throughout, finished in japan and nickel, and is supplied complete with electric light, attachment cord, and plug, ready for immediate use.
