## THE MUSIC SHOP FOR MIDI

Passport Designs, Inc.

Commodore 64

Disk; \$99.95

*The Music Shop* has proven to be one of the better music packages for the Commodore 64. Passport has taken this program one step further, adapting it for use with MIDI-equipped synthesizers. To use *The Music Shop for MIDI* you will need the Passport MIDI Interface Card, available separately. Additionally, the program will not work unless it is hooked up to a synthesizer. The MIDI version will use files created by the non-MIDI version.

The MIDI interface is about the size of a typical game cartridge, and plugs into the cartridge port. It has three short wires with DIN sockets on the ends. These are for MIDI-in, MIDI-out, and drum sync. The MIDI-in and out go in daisy chain fashion to any MIDI keyboards and drum machines you may have. The drum plug provides the clock signals necessary to sync any non-MIDI drum machines.

All features of the program are unchanged from the earlier version (see review last issue). The only changes are additional menus for the MIDI features, falling under the TOOLS MENU. The first feature is the MIDI ON/OFF function. When this is in the on position, notes may be entered onto the staff using your synthesizer. This is *not* real time entry of the music. If you currently have a quarter note selected for entry and you hold a G on the synthesizer, a quarter note G will appear on the staff. If you hold a chord, that chord will appear. To change to a different note you will have to resort to the computer keyboard. There is no provision within the program to do any real-time recording. The sole intention of this program, as of the original, is to allow you to enter music on a staff and then have the computer play it back. The MIDI enhancement only

*Useful, or necessary, for operation of The Music Shop for MIDI: 64, monitor, printer, drive, joystick, keyboard. Not shown: MIDI Interface Card. READER SERVICE NO. 280*

*Motherboard of Enhancer 2000 drive.*

**READER SERVICE NO. 281**

makes it sound better.

The other MIDI menu is the SETUP MENU. This one facilitates the distribution of the music on up to four synthesizers. Depending on the staff that you are using, you may be able to use either two or four synthesizers. With one type of staff you have a separate staff for each synthesizer. With others you assign a note to a specific synthesizer by pointing its stem either up or down. There are eight presettable SETUP MIDI menus, allowing you to change your synthesizer/instrument definitions numerous times within a composition. Depending on what type of synthesizer you are using, you may not be able to take full advantage of the multiple instruments. Some synthesizers are only capable of producing one instrument at a time. I tested this program using a CASIO CZ-101. This is capable of producing four instruments at once, and worked flawlessly with *The Music Shop*.

*The Music Shop* with MIDI is an excellent adaptation of the earlier version. If your only interests are entering music on a staff and having your compositions played back in multiple instruments, this program will serve your needs well. If, on the other hand, you require real time entry features, you will not be able to use this package.

Passport Designs, Inc., 625 Miramontes St., Half Moon Bay, CA 94019 (phone: 415-726-0280).

## ENHANCER 2000 DISK DRIVE

The Comtel Group, Inc.

Price: \$219.95

The first thing you'll notice about the Enhancer 2000—especially if you're short of desktop space—is its small size. At 10 X 7.3 X 2.5", its total volume is just under half of the 1541. The main reason for the drive's compactness is its externally located power supply.

Regarding compatibility with the 1541, most of the software tested worked perfectly, with the exception of some recent releases (including *Beach-Head II* and *The Music Shop*). Also, the drive did not work with the Epyx *Fast Load* cartridge. The Comtel Group informed us that while they were aware that the production model tested for this review was not 100% compatible with the 1541, newer models would be.

# REVIEWS

Formatting time is about 22 seconds. The aforementioned newer models, the Comtel Group assures us, will be faster by 30%.

The drive door is a hinge type reminiscent of the older 1541's. It seemed rather fragile, foreboding jamming problems after long periods of use. Three indicator lights are located on the front: a green power light and an amber error indicator below the disk insertion slot, and a red drive in use light above the slot. On the back are the dual serial bus, power socket, and power switch.

Inside, the drive has two circuit boards, with the main board located below the drive mechanism. Four of the chips on the main board have sockets, so if it does become necessary to replace them, it would be fairly simple to do so. The drive mechanism itself is a JVC direct drive motor.

I found changing the device number of the drive quite easy. The cover must first be removed to expose the main board. The jumper block is located on the rear left edge of the board. Using a pair of long nose pliers or tweezers, one or both of the jumpers can easily be removed to give you the device number needed, from 8 through 11. If later you decide to change the device number back to 8, just place the jumpers back accordingly.

A bonus disk included with the drive contained 12 programs. Besides the usual array of diagnostic programs that come with a new drive were several useful utilities, such as *Copy-All64* (disk backup utility), *Disk Log-Printer* (gives you a print-out of your disk directory), *Disk Doctor* (allows you to edit tracks and sectors), and *Change Disk* (for changing the device number of the drive via software). Two games, a mortgage program, and a computer quiz were also included.

The manual is similar to the *1541 User's Manual*, but contains slightly less documentation. Explanations are given of all available DOS commands.

The manufacturer includes a limited one-year warranty, and for an additional \$35.00 you can extend it to a second year. Considering the life-

span of most 1541-compatible drives, I would recommend spending the extra \$35.00 for the extended warranty.

I found the Enhancer 2000 to be an efficient workhorse with a very quiet operation. After four hours of continuous functioning in 90 degree temperature, it performing flawlessly. Though the drive's list price is \$215.00, it is expected to sell in the \$169-\$189 range.

The Comtel Group, 1651 East Edinger, Suite 209, Santa Ana, CA 92705 (phone: 714-953-6165).

## VIEWTRON

### Viewdata Corporation of America, Inc.

"Viewtron? What's Viewtron?" It seems that every time I mention this new videotex service the response is the same. If you haven't heard of it by now, grab hold of your socks while I tell you what you've been missing!

Videotex is a type of system that allows information to be transferred between the host and the user as full color graphics. Through the use of its own special software, Viewtron offers the user access to a wealth of on-line information with every single page in full color.

What's offered besides pretty pictures? How about reviews and ratings of more than 600 pieces of Commodore software and hardware, with new reviews added every two weeks? It's not a one way street, either. They want to know what *you* think about the items mentioned. Plus, nearly every item reviewed can be ordered while you are online from a major mail order firm, at a discount.

If being able to order while online whets your appetite for more, you'll love the next feature. Viewtron has a special electronic auction that is open to all users. Many major brands are "put on the block" every day. The prices keep dropping every 15 minutes until the items are sold. It doesn't matter how low a price goes; the item stays until it's bought, even if it ends up selling for \$1.00.

Ready for the communications part of the system? Then move over to the online CB simulator and talk to other

84 **AHOY!**

Viewtron subscribers. Live and in color! With subscribers from around the country, you're sure to always have someone to chat with.

Need help or advice about something? Query one of the many qualified experts in the "Ask Our Expert" section. Consumer advice, pet care, fashion and beauty, even plant care. And if your worries are getting you down you can shift to the travel section and book yourself a seat on a flight to any point on the globe. You can even make reservations for a trip by hot air balloon or relaxing ocean cruise.

After coming back from your vacation you might find yourself wondering about how the rest of the world fared while you were away. Flip on the computer and dial up Viewtron! World, national, and local news are available. (Viewtron's parent company is Knight-Ridder Newspapers, Inc., so you know you'll always have access to late-breaking headlines.) Sports news is of primary importance to many, and whether your sport is baseball, soccer, or auto racing, you can get full and accurate reports about any of them.

Perhaps, like many of us, you're watching your money carefully these days. By offering several "bank at home" services, Viewtron makes it simple. You can also get up-to-the-minute reports on the stock market, commodities, bonds, gold, and worldwide currencies. Information about the real estate market is also to be had.

Like a little entertainment after all this? Scan over to the games section. Many different games and quizzes are online, along with a self-test section that can help you learn more about the type of person you are. And with trivia all the rage nowadays, Viewtron was not about to be left out; its trivia section has questions geared to experts and beginners. The silver screen is not forgotten either. (That's movies to you youngsters.) Movie news, movie trivia, movie reviews, and even an Academy Awards quiz can be found.

Are you a soap opera buff? My wife is a devout fan of several, but

finds it hard to watch both the shows and our children during the day. She generally tapes the shows and watches them after the kids are asleep, but what to do when the VCR chews up the last 15 minutes? Viewtron to the rescue! With a complete summary of each show posted daily we never have to worry about missing our soaps.

Some of you may be asking, "Gee, B.W., this sounds great, but how's the service? What if I have a problem?" Let me reassure you. Viewtron has the best customer service department it has ever been my pleasure to call! I cannot believe how friendly and willing to help they are. There are no delays or forgotten promises to "call you back" here. These people are professionals and it shows. It seemed to me that everyone I dealt with at Viewtron had a real and honest desire to help me in any way possible.

What does access to this amazing world of information cost? \$9.95! That price includes a disk with the special terminal software needed to use the system, one free hour of service, an ID and password, and a user manual. Subscribers pay only for their use of the service. There are no monthly fees or minimum use charges. Connection rates are \$.09 per minute weekdays after 6 p.m. and weekends, and \$.22 per minute weekdays. There is no extra charge for use at 1200 baud. (Prices may vary in some cities.)

## MICROLINE 192 PRINTER

**Okidata**  
**\$499.00**

I have been using Okidata products as far back as the Microline 82A. They have established a reputation as a company that manufactures fast, dependable printers. The 82A was a 120 cps workhorse, and the 92A basically a "super" 82A; but the 192 is a quantum leap forward.

The housing for the 82A and 92A was far from sleek. They were big, heavy, and relatively noisy. The 192,

# REVIEWS

on the other hand, is slim, trim, and quiet. Housed in a tan plastic case (14.2"W X 10.8"D X 3.2"H), it weighs in at a mere 8.8 lbs. The first impression that this printer gives is that of a toy. I lost count of the people who saw it and asked, "Is it thermal?" Once this tiny powerhouse is activated, though, all skepticism is overcome.

Two primary text modes are available: Data Processing (DP) and Correspondence Quality (CQ). Print speeds are 160 cps and 33 cps respectively. If you were to race the 192 against another 160 cps printer, the 192 would win. This is because the 192 kicks into a 200 cps mode when it encounters spaces. If you were printing out two columns, the printer would output the data at 160 cps and speed up to 200 cps as it moved on to the next column. The CQ mode is one of the finest I have ever seen. I would consider it perfectly acceptable for all applications short of a resume. When in this mode, the printer uses a two-pass technique to print in a 17 X 17 matrix (DP mode prints in a 9 X 9 matrix). Additionally, in emphasized or enhanced modes the speed is 80 cps.

No fewer than 13 character sets are included, among them ASCII, no-slash zero ASCII, international sets, and an IBM character set capable of producing IBM graphics characters.

On ground equally high as the text modes are two graphics modes: APA, and Block. The Block graphics are standard TRS-80 graphic characters, but the real power lies in the APA graphics. This is the dot-addressable graphics mode. Available are six resolutions: 60 X 72, 72 X 72, 120 X 144, 144 X 144, 240 X 144, and 288 X 144 (all resolutions given in dots per inch). This variety is sufficient for almost any graphic application.

Besides the raw power of the printer hardware, this printer is a pleasure to use for two other reasons, namely the manual and the menu select mode. The manual is very well written. It will taken even the beginner through the setup and use of the printer. The menu select mode is a system by which the front panel

## THE MACHINE SHOP

FS! Software

Commodore 64

Disk; \$40.00 (see below)

Discussions on machine language programming are generally concerned with the creation of programs. Very little is said on the analysis or disassembly of machine code into a more readable form. There are numerous utilities available which support the creation of machine language programs. These range from simple machine language monitors to full blown macro-assemblers. The former will handle code just one instruction at a time. The latter support the creation of multi-kilobyte programs. Although machine language monitors will disassemble code one line at a time, they are totally inadequate for programs longer than a few dozen instructions.

As Commodore users we encounter machine language programs in great abundance. They are frequently used as subroutines to speed up critical operations that BASIC just can't handle. A tool to convert this code into a more readable form would be a great boon to anyone wishing to learn more about the subject. *The Machine Shop* from FS! Software is just such a product. It permits the creation of machine language programs from nearly standard MOS source code, as well as the reverse process.

*The Machine Shop* for the C-64 is not a new product. It is actually an

updated reincarnation of *Develop-64*, one of the first assembler development systems for the C-64 and the VIC 20. Originally published by French Silk Smoothware, the company has been reformed under the name of FS! Software. The company's name derives from Don French, the proprietor, and the Jacquard loom. This device was the first to utilize a punch card program for the weaving of French Silk in the early part of the 19th century.

The package is actually two utilities which can be configured to interact in a most intimate fashion. The first is *Develop-64*, a full-featured Macro Assembler. The second is *Decode-64*, a three-pass symbolic disassembler and cross-referencer. It is the latter program which gives *The Machine Shop* its unique and powerful capabilities.

*Decode-64* can analyze a block of data, in RAM or on disk, and generate a fully cross-referenced assembler source code file, complete with labels, for user analysis or for incorporation into a *Develop-64* source program.

The best part of the deal is that *The Machine Shop* does not have to cost you a penny. It is one of those rare "freeware" packages where the user pays for the program after having tried it out. Anyone who already has a copy is encouraged to distribute additional copies (of the disk only) to anyone else who might be interested. This is a complete turnaround from the copy protected original distribution of this package. If you like what you see, a \$40 payment to FS! Software will get you the complete documentation for the package. You will also receive with your payment a one-year subscription to *Machine Code*, a new quarterly magazine for machine language programmers. The first issue is expected to be published at about the time you read this (Fall 1985). Note that FS! Software will only supply *The Machine Shop* as a complete package for the established price.

### DEVELOP-64

This is the heart of the package. It is a full-featured macro-assembler which closely follows many of the

conventions of the original MOS Technology specifications for 6502 source code. It features an easy to use full screen editor based on the native editor of the C-64. As with the BASIC editor, line numbers are required. However, these are automatically generated. The user references the line numbers only when listing, inserting, or deleting lines. The editor also supports string search and replace, as well as block move and copy. The program performs syntax checking on each line as it is entered. This insures that the resulting source code listing will at least be syntactically, if not logically, correct.

Source code programs, in memory, can be up to 2200 lines long. This in no way limits the size of a complete program. *The Machine Shop* fully supports the disk drive. Any number of disk files can be linked up to the capacity of a single disk. In addition, *Develop-64* supports macros and library files. The former allow passing of up to eight parameters to the subroutines. The latter do not permit parameter passing.

Macros and library files in machine language are similar to subroutines in BASIC. They are standard blocks of code which you may use in many of your programs. Although they are not an essential feature for the writing of machine language programs, they are a great convenience. The macro feature allows the source program to call in these subroutines as required. The final code is assembled with the macro code as an integral part.

Interestingly enough, *The Machine Shop* distribution disk lacks a dedicated machine language monitor (MLM), even though there are a number of very good ones in the public domain. (Most other assembler packages we have seen include one of these MLMs.) *Develop-64* does have most of the MLM features built in. The Debugger function is extremely effective in this regard. This built-in utility lets you display memory 160 bytes at a time. The ASCII representation of the code is listed alongside the hex values. In single step mode the contents of memory

## GUARANTEED SOFTWARE

### VIZASTAR for the C128

Vizastar, the integrated spreadsheet, database and graphics program that has the Commodore 64 world raving, is now available for the C128. It boasts 80 columns, and has over 40K of free memory in the spreadsheet. Those who already own Vizastar 64 will be pleased to know that your existing files can be read by Vizastar 128. Also, you can upgrade to the 128 version. Call us for details and pricing.

"The only other comparable product would be Lotus 1-2-3 for the IBM PC; nothing in the C64 world comes even close to the features of Vizastar."

AHOY July 85

"I found Vizastar would do anything Lotus 1-2-3 could, and then some. It's my Commodore choice to become the standard against which the others will be judged."

INFO 64 Magazine, Issue #7

"Vizastar is an exceptional package that rivals the features of programs such as Lotus 1-2-3 and offers C64 owners the kind of integrated software previously only available for higher-priced systems."

RUN Magazine, June 1985

"I scrutinized, tested and experimented with Vizastar extensively, but could find no weaknesses whatsoever. It is the most comprehensive, most flexible, most powerful and easiest to use integrated software package I've worked with."

Commodore Microcomputer, Sept/Oct 1985

"I use an IBM PC at work with Lotus 123. I feel Vizastar is just as good and in some ways better than 1-2-3."

Steven Roberson, NC. End User

"I have used Multiplan and Superbase; both are good pieces of software, but are inadequate when compared to Vizastar."

Jim Mathews, WA. End User

"So good, I bought a second C64 and Vizastar for my office. A wild bargain! You've saved me from having to buy IBM and Lotus."

Philip Ressler, MA. End User

### VIZAWRITE CLASSIC for C128

This is the new word processor from Vizastar's author, Kevin Lacy and is the successor to Omnivriter, which he also wrote. All the features of Omnivriter are there, plus many significant enhancements, like auto pagination, on-line help, pull-down menus, full-function calculator and more. Up to 8 'newspaper-style' variable-width columns can help with newsletters.

Three different proportionally-spaced "near letter quality" fonts are also built-in for use with Commodore or Epson compatible printers. You can merge almost any other word processor file directly into Vizawrite, including Paper Clip and Omnivriter. Naturally, it is also compatible with Vizastar. At all times, what you see on the screen is exactly the way it will be printed out. Vizawrite can do mail-merges and has an integrated 30,000 word spelling checker that you can expand yourself.

### PROGRAM SPECIFICATIONS

Both Vizawrite and Vizastar are written in 100% machine language and run in the 128's FAST mode, making it lightning fast. They require a C128 with 80 column color or monochrome monitor. Both come with a cartridge, a diskette, a backup, and a reference manual. Vizastar also includes a 50 page tutorial book. Both work with 1541 or 1571 disk drives.

### RISK-FREE OFFER

Vizastar 128 is priced at \$119.97. Vizawrite's price is \$79.97, but as an introductory offer, it is now only \$69.97. Vizastar 64 XL8 is now available for \$119.97. We are so positive you will be satisfied with our programs that we offer a 15-day money-back guarantee. Try it Risk-Free. Call us today or send a check or money order. VISA/MC accepted.

Calif. residents add 6.5% Sales Tax. Add P&H: UPS-\$4; COD/Canada-\$7.

are disassembled one instruction at a time. The contents of all of the microprocessor's internal registers are continuously displayed and updated. The trace function disassembles code in a continuous stream while maintaining the control of the single step feature. Output can be directed to either the printer or the screen. Up to ten break or go points can be set for the trace mode.

## DECODE-64

This program is the highlight of the package. It generates a fully labeled disassembly of a block of code from memory or disk. The output can be sent to either the screen, printer, or disk. In the case of the latter, the resulting source files can be directly used by *Develop-64*. The size of disk files are automatically limited to 2000 lines each. Labels are created following a predefined set of rules. Each label contains the originating address in hexadecimal or decimal. The latter are useful for referencing by BASIC's SYS cells. The labels also identify the

calling instruction as to type. For example, a J indicates a JMP and an R indicates a relative branch. External references are also identified, as are all zero page references.

As we mentioned, *Decode-64* is a three-pass symbolic disassembler. This means that each disassembly is created on the third scan of the data. In the process a complete symbol table of all the generated labels is created. A useful adjunct to *Decode-64* is the built-in cross referencer. When activated, this routine scans the resulting source code symbol table. All labels are listed with every line number at which they appear. An asterisk identifies the line number which defines the label.

Not all machine code represents executable instructions. Many parts of a program are actually data such as screen messages, numerical constants, program vectors, and so on. Trying to disassemble these parts of the code will waste processing time at best and produce misleading and incorrect code at worst. *Decode-64*

lets you mark off blocks of code as data not for disassembly. Up to eight such areas can be so defined.

It is up to the user to select the code for this restricted treatment. This can usually be done by a quick disassembly with an MLM. When a lot of illegal opcodes start to show up, this is most likely a data area. A simple memory scan will also serve to display any readable ASCII message blocks. The Debugger portion of *Develop-64* will do this job well.

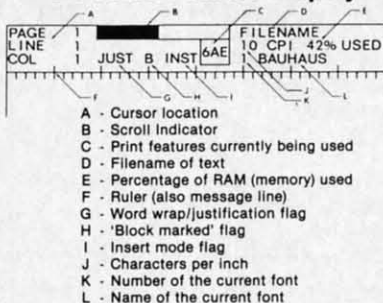

Both *Decode-64* and the Cross Referencer can be merged with *Develop-64*. The result is a tradeoff where some features are enhanced while others are limited. Most significant is the ability to preassemble a label file which identifies some of the more common machine language calls in the C-64. For example, a complete list of all of the Kernal calls is included on the distribution disk. The symbol table created by this preassembly is kept in memory when *Decode-64* is used on an object program. All calls to the predefined symbols will be properly labeled in the resulting disassembly. The only significant limitation to the merged *Decode* and *Develop* utilities is the inability to mark off data areas in the object code.

## THE DOCUMENTATION

We had better get into some detail on this, as it may be the only part of the package you will be paying for. What you get will actually be two books. One of these is a 14-page pamphlet which describes the operation of *Decode-64* in some detail. Although quite readable by most software documentation standards, you will be well advised to run *Decode-64* through its paces as you go through the book. Nothing beats hands-on experience when learning a complex package of this sort.

The other book is a nine chapter, nine appendix volume called *Inside the Commodore 64* by Don French. Don't panic! The instructions for *Develop-64* are only a small part of this, appendices E and F to be exact. The first is a quick run through of its features, while the second takes care of

### On Screen Status Display

### Overview of FONTMASTER word processor features:

- 1) Powerful block manipulation commands (Cut, Paste, Move, Overlay).
- 2) User - friendly effects include (fonts, super/sub scripts, underlining, bold face, etc.)
- 3) Up to eight different fonts can be used simultaneously.
- 4) Many printing options such as page numbering, titles, word-wrap, right justification, and more.
- 5) Eight disk I/O commands (Save, Load, Verify, Erase, Etc.).

Create Your Own or choose from over 15 type styles provided in this unique program. Epson/Epson compatible/Star Micronics printer. 1541 drives only.

# REVIEWS

the details. Once again, keeping the program and computer at hand will be helpful.

The major part of the book is devoted to a detailed description of the hardware and software features of the C-64 as they relate to machine language programming. The chapters are about equally divided on the instruction set of the 6502/6510 microprocessor and the specific details of the C-64 environment. Emphasis is given to the operation of the C-64 graphics and sound chips. Conspicuous by its absence is a discussion of the C-64 I/O functions of the user or serial ports.

## CONCLUSIONS

*The Machine Shop* in its present incarnation is definitely a best buy. If you have not yet selected an assembler/disassembler for your own use, you will not go wrong with this one. Rumor has it that something of a cult following has developed over the original issue of this package. At least one major text on C-64 assembly language has adopted *Develop-64* as the assembler for all the in text examples. *Assembly Language Programming with the Commodore 64* by Marvin L. DeJong is a 296+ page text on the subject available from Brady Communications (division of Prentice Hall).

FS! Software, P.O. Box 635, Fari-bault, MN 55021 (phone: 507-332-8122). —Morton Kevelson

## THE B.E.S.T. GENERAL LEDGER MANAGEMENT SYSTEM

**B.E.S.T. Inc.**  
**Commodore 64**  
**Disk; \$69.95**

If you're looking for accounting software, you're probably planning to do more than prepare your household budget. To set up a computerized accounting system with a minimal financial outlay, a C-64 and *The B.E.S.T. General Ledger Management System* represent a reasonable choice.

Such a system would be suitable for keeping the books of a small business, social organization, or (for you diehards) household. I include only small businesses more for hardware

and your vendors just cannot be plugged into a computer program. Second, people must enter financial data into the computer. Accounting software eases the (necessary) pain of keeping the books; it doesn't free you of the task.

That caveat behind us, let's take a look at the power of B.E.S.T.'s *General Ledger*. On a single data disk, you can store 24 months of financial activity. This is a long enough period that you can do some meaningful trend analysis. For each month you can store up to 1500 general ledger transactions entries. As with any general ledger, you must decide the level of detail that each entry will represent. You can, for example, enter each cash sale for the day, or you may choose only to enter total cash. Obviously, the more detail you choose, the more work you will have to do and the better your predictions will be.

You may set up as many as 200 general ledger accounts or types of transactions. Typically, you begin by manually preparing a Chart of Accounts that lists each type of financial transaction. Accounts are usually grouped into categories including assets, liabilities, capital, income, and expense. Types of transactions under expense might include accounts like salaries, payroll tax, insurance, rent, telephone, postage, and supplies.

To let you watch future income and expenses, B.E.S.T.'s *General Ledger* allows 200 accounts receivable entries per month as well as 200 account payable entries. B.E.S.T. has separate programs available for each function. All transactions are entered through the general ledger and may then be automatically posted to the other programs.

Accounts receivable should be maintained separately if you extend a lot of credit to customers. Your general ledger will only show the account and the amount owed. In a separate accounts receivable, you would have more information, like a complete customer list, items purchased, amount owed, due date, and a record of credit payments. You could produce aging reports listing payments 30, 60, or 90 days overdue, and may-

be even print invoices. A separate accounts payable package would be similar, but would deal with vendors to whom you owe money rather than customers who owe you.

Other than automatic posting to accounts receivable and payable, the most important feature of B.E.S.T.'s *General Ledger* is its report writer. You can create, edit, list, print, or delete reports with almost any combination or permutation of the data you have entered. Only if you have had to use a report format designed by someone else unfamiliar with your business will you know how important custom design can be.

And B.E.S.T. has built-in flexibility. When you decide to print your report, you will find that several variations are allowed without having to go back and edit the report design. Balance sheets, income statements, comparison reports (year-to-year or quarter-to-quarter), and performance analyses (percent-of-total reports) are all available.

If you'd like, this program will even print your checks automatically. I was especially fond of the "test print" feature that let me check the alignment of the checks in the printer. Although I began with a complaint about the speed of the C-64, you need to know that *General Ledger* can bring any account to your screen for review within 4 seconds. It does so by indexing information on the disk. The price you pay is a 16- to 20-minute wait (with a 1541 drive) while the program formats a new data disk and creates its files.

Odds 'n ends: B.E.S.T.'s *General Ledger* will work with one or two drives. Two means much less disk swapping. Error messages are translated into English. Sorry if you have all those numbers memorized. The program completely controls the keyboard. Neither accidental nor intentional improper keystrokes will crash the program. Last and best, B.E.S.T. allows you to back up the software. Any old 1541 backup utility will do, thanks.

Business Electronics Software and Technology, Inc., P.O. Box 852, McMinnville, OR 97128 (phone: 503-472-9512).  
—Richard Herring

# COMMODORE ROOTS

## GETTING GRAPHIC

### ASSEMBLY LANGUAGE TECHNIQUES FOR GRAPHICS PROGRAMMING

By Mark Andrews

If you've ever tried to write a high-resolution graphics program and wound up frustrated by the graphics limitations of Commodore BASIC, agonize no more. In this and the next few editions of *Commodore Roots*, we'll explore some of the techniques professional assembly language programmers use to write arcade-style games and other kinds of graphics-oriented programs.

As you may know, the Commodore 64 has two primary screen modes: a text mode and a high-resolution graphics mode. In text mode, the C-64 is capable of displaying up to 1,000 characters at a time on its screen, arranged in 25 lines of 40 characters each. To hold the 1,000 characters, the 64 uses a specific block of memory exactly 1,000 bytes long.

This segment, called screen memory, normally starts at Memory Address 1024 (\$400 in hexadecimal notation) and extends to Address 2023 (\$7E7 in hexadecimal). It is often pictured as a grid of rectangles measuring 40 columns wide by 25 rows high, with each rectangle representing one character on the screen. Figure 1 is a map of the segment of memory most often used as screen memory in Commodore 64 programs.

Figure 1: A C-64 Screen Map

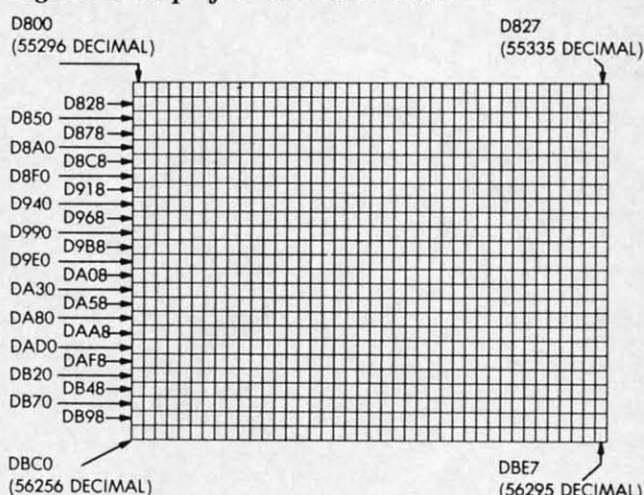

acters, but a special set of screen codes that includes many characters not present in the standard ASCII character set. A complete list can be found beginning on page 132 of the *Commodore 64 User's Guide*, and on page 376 of the *Commodore 64 Programmer's Reference Guide*.

Once you know what these screen display codes are, and where the screen display memory in your computer is, you can print text and graphics characters on your computer's screen by POKEing their screen-code values directly into the appropriate addresses in screen memory. In this way, you can bypass your computer's screen editor anytime you like, and print anything you like directly on your screen.

In addition to its 1,000-byte block of screen memory, the Commodore 64 has a corresponding block of color memory. This segment of RAM begins at Memory Address 55296 (hexadecimal \$D800) and extends to address 56295 (\$DBE7 in hex notation). Color RAM, like screen RAM, can be visualized as a 40-column by 25-line matrix of rectangles, with each rectangle representing the color of one of the 1,000 characters that can be displayed on the C-64 screen. Figure 2 is a map of the block of

Figure 2: Map of C-64's Color RAM

(Charts reprinted from *Commodore Roots: Assembly Language Programming for the Commodore 64*, courtesy of Howard W. Sams & Co., Inc.)

When you type a character, your Commodore 64's operating system translates that character into a code, then prints the character on your screen by storing its code number in the appropriate screen-map location. The codes used for this purpose are not the standard ASCII codes which computers often use to represent typed char-

color RAM used by the Commodore 64.

When a character is to be displayed in a given color on the C-64 screen, the screen map illustrated in Figure 1 and the color map illustrated in Figure 2 are used together. First, the desired character's screen code is stored in the appropriate memory location on the screen map.

Then another code, which represents the color in which the character is to be displayed, must be stored in the corresponding memory location on the color map. Since both maps are exactly the same size—40 columns wide by 25 rows high—the color map can be thought of as a color overlay which can be placed on top of the screen map. Each rectangle on this color overlay can be displayed in 16 different colors—and when the code for a given color is stored in a given location on the color map, that is the color in which the character in the corresponding location on the screen map will be displayed.

The 16 colors that can be displayed on the C-64 color map—and the code numbers that are used to display those colors—are listed in Table 1.

**TABLE 1**  
**Commodore 64 Color Codes**

Code Number	Color	Code Number	Color
0	Black	8	Orange
1	White	9	Brown
2	Red	10	Light red
3	Cyan	11	Gray 1
4	Violet	12	Gray 2
5	Green	13	Light green
6	Blue	14	Light blue
7	Yellow	15	Gray 3

The short BASIC program titled BALLBOUNCE.BAS (see page 124) illustrates how the C-64 screen map and color map work together.

BALLBOUNCE.BAS is not a high-resolution graphics program; it uses the C-64's standard 40-column text mode. In Line 40, a loop is used to place a red overlay across the top two thirds of the screen—from the top line down to the line that begins at Memory Address 55976. When this red overlay is first put in place, it is invisible, since nothing has been drawn yet on the screen. But as soon as something is printed on the portion of the screen covered by the overlay, it will show up in red.

After the red overlay is in place, a yellow one is laid down. This yellow overlay is just one pixel high; it runs across the screen horizontally. In the BALLBOUNCE program, this overlay is used to draw a yellow line: the line that represents a floor (or the ground) as a red ball goes bouncing across the screen.

Once the red and yellow overlays are in place, the words "FOLLOW THE BOUNCING BALL..." are printed in white across the top of the screen. Then, in Lines 210 through 240, the ball is animated. The animation technique is crude, but quite effective; PRINT commands are used to erase the ball and redraw it as it bounces across the screen.

### A HIGH-RES GRAPHICS PROGRAM

A more sophisticated technique for creating screen motion is illustrated in the program titled BLACKBOARD.BAS on page 124. Like BALLBOUNCE, it is written in Commodore 64 BASIC. But, unlike BALLBOUNCE, it is a high-resolution graphics program. The BLACKBOARD program clears a section of memory that will be used as screen memory, and then it draws a pair of crosshairs on the screen using high-resolution graphics. But it does this job very, very slowly, clearly illustrating the snail's pace at which BASIC usually executes high-resolution graphics programs.

Here's how BLACKBOARD.BAS works:

The C-64, as pointed out earlier, has two primary screen modes: a text mode and a high-resolution graphics mode. In the latter, the 64 produces a screen display that measures 320 dots (or pixels) wide by 200 dots (or pixels) high. That's a total of 64,000 separate dots, each one of which requires one bit of memory. So it takes 8,000 bytes of memory to produce a high-resolution screen display.

When the 64 is in its high-resolution mode, it does not generate a screen display using ASCII characters stored on a 40-column by 25-row screen map. To create a high-resolution display, the 64 uses a screen map that occupies 8,000 bytes, or 64,000 bits, of RAM. Each of these bits can be individually controlled by the programmer. If a bit is on, the dot that it controls will be lit. If a bit is off, the dot that it controls will be dark.

High-resolution screen maps can be placed in various memory blocks (the reason this is true will be explained in a later column dealing with memory management). Colors are controlled by "overlays" in high-resolution

### Make your C-64 or VIC versatile with:

#### Custom Character Sets: CHARED for the C-64

##### Features:

- Menu Driven with full screen display
- Save and Load Character Sets
- Use with Multi-color Mode
- Built-in Utilities for reverse, copy and boldface characters
- Use with BASIC or ML
- Create Fonts or Game Graphics
- Keyboard or Joystick Input
- Cut and Paste Feature
- Specify CHARED

##### Sports:

Mr. GOLF for C-64

##### Features:

- Course design and game programs
- Trees, Sandtraps, user designed Greens
- Built-in Adjustable Pin Placement
- Hi-Res ML Graphics for speed
- 18 hole course included
- Unlimited number of Courses
- Slice and Hook around Obstacles
- Specify Mr. GOLF (joystick required)

#### Word Processing: TexED for the C-64 and VIC-20

##### Features:

- Document editing: Create, modify, save tape and disk SEQUENTIAL data files
- Line Image Editor using simple commands
- Full Screen Editor
- Print command with indentation and margin control
- Complete User's Guide included
- Specify: TexED for C-64, TexED20 for VIC-20 with 16K expansion

##### Graphics:

PLOTVIC8 Hi-Res Graphics Kit for the VIC-20

##### Features:

- Menu Driven with Full Screen Display
- Keyboard or Lightpen Input
- Basic Geometry (point, line, ellipse) element-color selection, 3-D
- Screen to printer or plotter (Hi-Res)
- Functions stand alone for use with personal programming (BASIC)
- User's Guide-illustrated graphics tutorial and technical explanations
- Specify PLOTVIC8 (requires 8K +)

graphics, just as they are on a text screen; the subject of screen colors will be covered later in this column.

Since one bit equates to one dot in high-resolution graphics, plotting the position of a dot wouldn't be difficult if the high-resolution screen were laid out using straightforward X/Y coordinates. Unfortunately, that is not how high-resolution screen plotting works on the C-64. Instead of being arranged as a matrix of dots 8,000 dots wide and 8,000 dots high, the 64's high-resolution screen is laid out exactly like a text screen: in a grid of rectangles 40 columns wide by 25 rows high. Within each rectangle are eight bytes of data, each sitting on top of another like pancakes. For example, this is what the letter "A" would look like displayed in high-resolution graphics in the upper left-hand eight-dot by eight-dot rectangle on a high-resolution screen:

**TABLE 2**

**Bit-Mapping a Character in High-Resolution Graphics**

Screen Location	Screen-Map Location	Binary Notation	Appearance
Line 1	Byte 0	00000000	
Line 2	Byte 1	00011000	XX
Line 3	Byte 2	00111100	XXXX
Line 4	Byte 3	01100110	XX XX
Line 5	Byte 4	01100110	XX XX
Line 6	Byte 5	01111110	XXXXXX
Line 7	Byte 6	01100110	XX XX
Line 8	Byte 7	00000000	

If another "A" were to be printed in the second position of the first row on a high-resolution screen—that is, just to the right of the screen position illustrated in Table 2—the bit pattern in the third column of Table 2 (labeled "Binary Notation") would be repeated in Bytes 8 through 15 on the high-resolution screen map. The next rectangle on the first row of rectangles on the screen would be controlled by Bytes 16 through 23 on the high-resolution screen map—and so on, all the way down to the bottom right hand corner of the screen.

This zigzag layout makes it easy to mix text and graphics on a C-64 screen, since text and graphics are laid out on the screen in exactly the same way. But it also makes dot-plotting somewhat complicated. To plot a dot on a C-64 high-res screen, you first have to figure out where the dot lies on a 320-dot wide by 200-dot high screen, using straightforward column and row coordinates. Then, since the C-64 high-resolution screen is subdivided into 8-dot by 8-dot rectangles, you have to break the screen down into a 40-column, 25-row grid by dividing each coordinate by eight. This division operation takes place in Lines 90 and 100 of BLACKBOARD.BAS:

```
90 CHAR=INT(HPSN/8)
100 ROW=INT(VPSN/8)
```

The next step in plotting the position of a dot is to figure out just where in the appropriate 8-dot by 8-dot matrix the desired dot lies. This calculation is carried out in Lines 110 and 120 of BLACKBOARD.BAS:

```
110 LINE=VPSN AND 7
120 BYTE=BASE+ROW*320+CHAR*8+LINE
```

Finally, you have to turn on the bit you have selected with a line such as this:

```
140 POKE BYTE,PEEK(BYTE) OR (2^BIT)
```

The above formula takes a long time to calculate in BASIC, and that is why BLACKBOARD.BAS runs so slowly. Next month, you'll get a chance to see how much faster the program runs in assembly language.

**INITIALIZING HIGH-RES GRAPHICS**

Now that you know how the high-resolution screen map works, let's look at the first part of the BLACKBOARD program and see what has to be done to put the Commodore 64 into its high-resolution graphics mode. The first statement in Line 20—BASE=2\*4096—defines a constant which will be used later in the program to point to the starting address of a high-resolution screen map. This screen map will start at Memory Address 8192, or \$2000 in hexadecimal notation. In the second statement

# COMMODORE-64

Reader Service No. 262

in Line 20—POKE 53272,PEEK(53272)OR8—the C-64's video interface chip (VIC) is told where to place its high-resolution screen map and where to find the data that it will need to display a high-resolution screen. The memory address used in this statement, 53272 (or \$D018 in hex), is the address of a memory register referred to in C-64 documentation as VMCSB. When the C-64 is in its bit-mapped mode, the lower four bits of the VMCSB register are used to specify screen colors, and the upper four bits are used to point to the location of the bit map that will be used for a high-resolution display.

In Line 30, the VIC chip is instructed to go into high-resolution mode. This instruction is issued by setting Bit 4 of a memory register known in C-64 literature as SCROLY. One function of the SCROLY register is to implement fine scrolling—a capability we will not go into in this column. The BLACKBOARD program makes use of another capability of the SCROLY register: determining whether the C-64 will generate a text screen or a high-resolution display. If Bit 4 of the SCROLY register is set, the 64 will generate a high-resolution screen. If Bit 4 is clear, the computer will produce a text display.

In Line 50 of BLACKBOARD.BAS, Memory Addresses 1024 to 2023 (\$0400 to \$07E7 in hex notation) are stuffed with the value 16, which will cause a white line to be printed on a black background. When the C-64 is in its low-resolution graphics mode, the segment of memory from 1024 to 2023 is used to hold the Commodore ASCII codes that are used to print characters on the screen. But when the 64 is in its bit-mapped mode, this segment of RAM is used as an "overlay" that determines what background colors will be printed on the screen. In each byte of this block of RAM, the lower nibble is used to determine the color of any bits that are turned off in the corresponding rectangle on the screen, and the upper nibble to determine the color of any bits within the rectangle that are turned on. Since BLACK-

BOARD.BAS draws a white line on a black screen, the value 16—or \$10 in hexadecimal notation—is stored in each byte of color RAM. Since 1 is the color code for white and 0 is the color code for black, storing the value \$10 in each byte of color RAM will cause a white line to be drawn on a black screen.

Line 60 of the BLACKBOARD program is nothing but a jump back to Line 200. In Lines 200 through 240, a vertical line is drawn down the center of the screen using a bit-mapping subroutine that appears in Lines 80 through 250. This subroutine employs the plotting formula described earlier in this column to print white dots on a black background on the screen.

The line that is drawn down the screen in Lines 220 through 240 is two dots wide. That's because it takes a two-dot width to form a good solid line on a Commodore 64 screen; a line only one dot wide tends to show up pale and gray. The loop that draws this line appears in Lines 225 to 240.

After the vertical line is drawn, a horizontal line is mapped across the screen in Lines 245 through 280. Horizontal lines that are one dot high look fine in Commodore graphics, so this line is just one dot high.

The BLACKBOARD program ends with an infinite loop at Line 290.

When you run the BLACKBOARD program, you'll see how your computer clears the bit map that extends from BASE to BASE+7999, then changes the background color of the screen to black. Then, ever so slowly, you'll see your computer draw a set of crosshairs on your screen. Next month, you'll get a chance to see how much faster the BLACKBOARD program would execute if it were written in assembly language. Then you'll get an opportunity to type, assemble, and execute a program that will enable you to draw pictures with a joystick on a high-resolution screen! □

## WOULD A SECOND INCOME OF \$1000 A MONTH... \$2000 a month... \$5000 a month come in handy?

If so, choose the amount that suits you and it's yours in exchange for a few hours of your spare time and use of your personal computer.

"THE COMPUTER ENTREPRENEUR"—is the hot new book you may have read about. Over seven years in research and development—this book has 100 fully detailed business plans for you to choose from. They range from a traditional local bookkeeping service for small businesses to a far-out program for handicapping the horses that makes a substantial income—and 98 others in between.

"THE COMPUTER ENTREPRENEUR"—is not another one of those "101 Ways" books with a paragraph or two of information about each business. Each business plan is fully detailed—how to start-up, how to operate, how to sell the service, how to keep the books, number of working hours required, capital needed, best location, city or county, etc. It even gives you a simple method of determining the best kind of business for you.

**AND YOU DON'T HAVE TO BE A COMPUTER WHIZ!**—In order to start or operate these ventures. No programming or fancy special materials needed. All of these programs run from "off the shelf" programs you probably already have.

A 65 year old man in Washington State makes \$500 a day with a TRS-80 model 1 and our book, "COMPUTER ENTREPRENEUR", using report #163.

A man and his wife in Arizona are making \$4000 a month, with only a couple of hours a day, using the methods in our business report #102.

There are hundreds just like these making a living or extra income using the methods in our book.

# CREATED BY USERS FOR USERS

## PROTECTION REVEALED

Take command of your software. End the spiral of buying copy-programs. *The Protection Revealed Handbook* unravels the puzzle of software protection. For authors and users — become a master of illusion. Learn how to protect or un-protect your software. Includes a large section on successful BASIC program security. Covers the latest evolution of copy protection techniques. Topics include:

- |             |                 |               |                 |                      |
|-------------|-----------------|---------------|-----------------|----------------------|
| Disk Errors | De-Compilers    | Extra Sectors | Nibble Counting | Header Modification  |
| Compilers   | Density Changes | Gap Bytes     | DOS Protection  | Non-Standard Sectors |
| Half Tracks | Nibble Back-Up  | Guard Band    | Auto-Loaders    | And much, much more  |

Reveals the mystical professional trade secrets of the Commodore 64 and 1541 Disk Drive. A disk containing 21 utility programs is included. This is the book for everyone!

**Book & Disk**

**\$19.95**

### THE PROTECTOR

A menu-driven collection of programs which promises to mystify the curious. Basic file *Encryption* and *Decryption* are the heart of this system. Also includes autoboot maker, write and un-protect disks, fast disk eraser, ML to data statements, sector editor, relocates files to new location in memory, un-new scratched files, plus much more.

A dozen plus programs — the perfect companion for the book, *Protection Revealed*.

**Disk**

**\$19.95**

### SUPER HELP

This is the programmer's friend — *three* aids for the price of one — a must for all users:

1. Poster size (21x25) screen and color memory map. Hang on the wall and never hunt for that *poke* location again.
2. One of the most complete C-64 memory maps available today. Compact and easy to read. Instructions included.
3. Set of 18 cheat cards. Includes: 1541 disk drive, DOS wedge, error messages, dasette, 1525, MPS-801, 1526, screen codes, Kernal ROM, sprites, color, sound, conversion charts, Pokes & Peeks, etc. Spiral bound.

**All Three Items For:**

**\$15.95**

### BRAND X — THE DISK LIBRARIAN

Has your disk library grown? Can't find your favorite program when you need it? Are you tired of odd labels? If you answered "yes" to any of the above, *you need Brand X*. *Brand X* can catalog 40-plus disks in one file — this is over 4000 programs. Save the catalog file, add to, change, or delete when you want. Get rid of duplication and save disk space. Identifies 14 types of files. Disk commands include: format (in 10 seconds), validate, scratch, change disk ID, change disk name, plus directory. Prints custom disk labels (great for the generic user), lists used ID's and disk names, catalogs in one, two, or three columns. End disk confusion with *Brand X, The Disk Librarian*.

**Disk**

**C-128 Compatible**

**\$19.95**

### PROGRAMMER'S KIT

Over 150 ready-to-run subroutines. Easy instructions on how to incorporate into your own programs. Why re-invent the wheel? Your time is valuable. Some of the types included are: TIS, protection, disk operation, printer operation, sorts, joy-ticks, input, graphics, complete alphabets, graphic screen prompts, sound, random choice. Program the easy way. Full documentation included.

**C-128 Compatible \$18.95**

### PHONE BOOK/POSTAL CLERK

A must for small businesses, clubs, schools, or individuals.

**2,500 + ENTRIES**

Menu-driven, compatible with all printers. Auto save entries and changes. Sorts and prints phone book or address labels by name, city, state, ZIP code, or group. Eight user-definable mail lists in one program. Keep groups, friends, clubs, Christmas lists, etc. all separate.

**C-128 Compatible \$24.95**

### ATTENTION GUN RELOADERS: BALLISTICS

Check trajectory for all popular rifle bullets by weight, caliber, or style. Includes tables for *Hornady* and *Speer* bullets, plus others. Allows for standard metro or high altitude and low temperatures. Prints out table of trajectory (choice of range increments), bullet drop, wind deflection, and more. If you reload your own shells, this program is a must!

**C-128 Compatible**

**\$39.95**

### \$-SAVER SWITCH

Use the *\$-Saver Switch* to connect two computers to one printer, or one disk drive. Better yet, use only one drive and one printer for two computers. A flip of the switch changes the device from one use to the other. Save dollars where more than one computer needs to access the same device. Plugs in — no alterations or extras.

**V-20, C-64, C-16,**

**Plus 4, C-128**

**\$29.95**

## VALUE-SOFT

# WORD PROCESSING BREAKTHROUGH!

SALE

SALE

40 or 80 Columns  
in Color

## Paperback Writer 64

40 or 80 Columns  
in Color

This is the easiest to use and most powerful word processor available for the Commodore 64. As you type on the screen, you will see your letters and words appear on the screen exactly as they will be printed (i.e. Italics will be *Italic*, Bold Face will be **Bold Face**). With the printer files you can customize Paperback Writer 64 to use all the fancy features of your printer. Loads EZ Script®, Paperclip®, & Wordpro 64® Files so you can easily upgrade your past wordprocessing text that you've written with obsolete wordprocessors. Take a look at some of the other features:

- **Wordwrap** — No Words Break At The Edge Of The Screen.
- **Flexible Cursor Movement**, Including Tabs And Other Timesavers.
- **Deletion And Insertion** Of Characters, Lines And Blocks Of Text.
- **On-screen Text Enhancement**, Such As Bold Face, Italics, Underlining, Superscripts And Subscripts, And Foreign And Other Characters.
- **Manipulation Of Blocks (ranges)** Of Text For Functions Such As Moving And Deleting, Even Between Files.
- **Sorting Lists** In Order Of Numbers And Letters.
- **Aligning And Adding Numbers** In Columns, Helpful With Tables.
- **Variable Margins** At Left And Right, And Paragraph Indentation.
- **Lines Centered, Justified Or Aligned** At The Right Side.
- **Variable Page Lengths And Line Spacing.**
- **Borders** At Top Or Bottom With Optional Title Lines And Page Numbers.
- **Linked Files** To Print Extra-long Documents In Sequence.
- **Flexible Printer Set-up** To Allow Use With Any Printer.
- **Find And Replace** Text Functions That Can Be Automatic.
- Complete Or Selective **Directories** Of Files On The Disk.
- **Sequential Files** For Mail Lists And Communication With Other Computers.
- **Spelling Checker**, Checks Your Spelling.

INTRODUCTORY PRICE

**\$29.95**  
COUPON  
Sale Price \$39.95

☆☆☆ Plus ☆☆☆

Full help screens on line with additional help on the disks mean you don't even need a manual. If you're in the middle of a page and you want to know how to use a special function just hit F7 and the information will appear before your eyes. If you still don't understand hit F7 again and a more detailed explanation appears. Then simply hit F8 and you're back in the letter where you left off. No manual lookup necessary. This is the easiest word processor in the world to use. List \$99.00.

Introductory Sale Price \$39.95. Coupon \$29.95.

### DOUBLE PROTECTO FREE TRIAL

We are so sure this is the easiest and most powerful word processor available, we will give you 30 days to try it out. If you are not completely satisfied, we will refund your purchase price.

**PAPERBACK DATABASE (Datafax)** List \$69.00. **Sale \$34.95.** \* Coupon \$24.95.

Add \$3.00 for shipping, handling and insurance. Illinois residents please add 6% tax. Add \$6.00 for CANADA, PUERTO RICO, HAWAII, ALASKA, APO-FPO orders. Canadian orders must be in U.S. dollars. WE DO NOT EXPORT TO OTHER COUNTRIES EXCEPT CANADA.

# CADET'S COLUMN

## BASIC Programming for Beginning Commodore Computerists

Including *Compuloan*, a Loan Payment Calculator for the C-64

BY CHERYL PETERSON

**T**his month I'm going to focus on BASIC. But even though this is a beginner's column, I am not going to degenerate into the standard explanations of PRINT, GOTO, GOSUB, OR, IF/THEN, and WHO CARES. There are many good books on BASIC programming, so who wants me to waste space saying it all again? If that isn't enough, Dale Rupert's column does a great job of teaching programming. Instead, let's take a look at some BASIC programming tricks and aids that will speed things up. I'll even throw in a program that I wrote. It's not fancy, but it works. Anyway, more on that later.

One great way to expedite BASIC programming is to cheat and use someone else's routines. Although it is illegal to steal programs that are copyrighted, many good programs are available in the public domain. (No, all those advertisements for "almost free" software are not rip-offs.) In fact, public domain software is a good source to build on. I intend to devote a whole column to public domain software later, but for now I'll just say that these programs are a good source of inspiration. They can also help you do very useful things.

One such program goes by the name *TX2BAS*. It takes a sequential (SEQ) file (like those created by many text editors) and converts it into a tokenized BASIC program file. Why would you want to do that? Although the Commodore screen-oriented BASIC editor is a vast improvement over the editors offered with other computers' versions of BASIC, it is still limited to the lines you can list on the screen. You don't have complete freedom of movement from top to bottom. With long programs, this can be a pain. Block moves, copies and deletes, along with global find and replace options, can really make programming flow faster. BASIC's editor just doesn't have them.

Text editors, on the other hand, offer such features, but the Commodore won't read "text" files as BASIC programs. *TX2BAS* solves the incompatibility problem.

Electronic bulletin board systems, accessed through

modems, frequently contain public domain BASIC programs that need only slight modifications to run on the Commodore. Unfortunately, these programs are usually stored as ASCII text files and although most terminal packages (modem software) will translate ASCII into PET ASCII, they won't translate SEQ files into tokenized BASIC files. Once again, *TX2BAS* solves the problem. There are several versions of it, the latest being *TX2BA4*.

Where can you get this wonder program? In addition to its presence on the following page, it can be found on CompuServe in the Commodore Beginners Special Interest Group (GO CBM 963) in Data Library 2. Type BRO TX2BA4.SEQ at the DL2: prompt, if you are using a terminal program that doesn't support CIS protocol. Once the file is found for you, choose the R prompt to READ the file into your buffer. You'll need to save the program to disk or tape to use it. If you are using Vidtex or some other package that can download .IMG files, type BRO TX2BA4.IMG. When the file has been located, use the D command to DOWNLOAD the file. Your terminal program should automatically save the file for you.

A document file, *TX2BAS.DOC*, explains how to use the program. I'd recommend downloading this file, because it has a useful description of how to use *TX2BAS* to merge programs together—a very handy feature if you have a library of routines that you like to use regularly. You can append the routines at the end of your program instead of typing them in repeatedly.

For those who don't have CompuServe protocol compatible downloads, you'll have to use the BASIC editor to type *TX2BAS*. Once you have it in runnable form, you need only follow the prompts to convert your files from SEQ to PRG. It only requires the name of the file to convert.

I must warn that my version is slightly different from the CIS program. The doc file mentions that once you've downloaded theirs, you must edit it slightly. In the original version, two lines that were included as remarks actually controlled whether *TX2BAS* sought the SEQ file

# TX2BAS

Letters on white background are *Bug Repellent* line codes.

Do not enter them! See page 122 for instructions.

on tape or disk. *TX2BAS* required removing the REM at the beginning of the line you wanted to use. My version asks whether the SEQ file is on tape or disk. It adds an extra keystroke, but gives more flexibility.

CompuServe's latest version, *TX2BA4* looks for the SEQ file on the device from which it was loaded. Both my version and *TX2BA4* required only a few lines of changes to make them easier to use.

This is just the type of thing you should think about doing: taking an already written program and modifying it to make it do what you want. Why duplicate someone else's work if they choose to give it away?

## FIGURING LOAN PAYMENTS

Although there are several programs available that will compute the payments for a loan, I decided to write my own. I used a formula for calculating loan payments from a general BASIC manual. I wrote the necessary GET statements and prompts to put the numbers in the formula, tried out several routines for rounding numbers down to two decimal places, wrote some print formatting routines, and added a couple of error trapping lines just to keep things from getting messy. Sounds easy, doesn't it? It took two days!

Even when you have a pretty good idea of what you want to do, problems crop up that you don't expect. If you're like me, you do a minimum amount of planning and jump right in with both feet. As you can see from the line numbers in my program listing, things weren't always as simple as I thought they'd be. And then when I really got moving I thought of a couple of neat additions to make the program nicer.

Earlier, I mentioned borrowing routines. Well, I went through three different ones to round numbers to the second decimal place. I finally settled on a one-liner, but at one time the routine at 2000 had eight lines containing two separate routines. As it turned out, the two of them just refused to work together. I wasted about five hours before I finally got through that section.

You see, programming is an inexact science. Actually, it's more of an art. Programming languages come in various shades, with peculiarities bound to each. And even within the same language, there may be many ways to accomplish the same end. BASIC is a flexible medium. As in painting, there is no "correct" technique.

Programs that you write for your own use do not have to be perfect! If they work for you, that's what counts. But there is always someone out there who just can't resist trying to fix a program up a bit. And that is what the public domain is all about. By putting your program out there, where people can see it, someone may just perfect it for you. The changes in *TX2BAS* are a "perfect" example.

Of course, you'll have to suffer the slings and arrows of those who think every program must be a work of art. Proponents of "structured programming" may well use your handiwork as an example of how *not* to write programs. And the ten year old down the block may laugh hysterically when he finds out the program wasn't writ-

# NEW LOW PRICES FROM THE WORLD'S LARGEST SPORTS SOFTWARE COMPANY!

Whether you're a coach, player, computer bug, statistician, dabbler, doer or just a real sports fan, PDS has a package for you...at our lowest prices ever! Check our line-up below, and then order your first PDS Sports Package.

**FOOTBALL STATISTICS.** A comprehensive computer software system. You compare teams in over 60 offensive and defensive situations and watch the matchups on the screen. Every team is given a power rating. PDS also provides "year-to-date" data diskettes for a nominal charge. 39.95

**FOOTBALL HANDICAPPING.** (Includes FOOTBALL STATISTICS Package). Forecasts the outcome of football games based on massive amounts of statistical data, morning lines and point spreads. 49.95

**BASKETBALL STATISTICS.** The most comprehensive basketball program ever written. "What-if" your way into every imaginable comparison and formulation. 39.95

**BASKETBALL HANDICAPPING.** (Includes BASKETBALL STATISTICS). Gives you an inside look into the outcome of games by mathematically equating statistics, lines and point spreads. 49.95

**BASEBALL STATISTICS.** See how opposing baseball teams stack up against each other. See summarizations. Performance stats on every team in the major leagues. 39.95

**BASEBALL HANDICAPPING.** (Includes BASEBALL STATISTICS) Makes you better-prepared to predict the winner of any game. At least, mathematically. 49.95

**THOROUGHBRED HANDICAPPING.** This "world class" program gives you an edge in predicting winners. A proven system...by PDS and many horseracing enthusiasts. 129.00

**HARNESS RACE HANDICAPPING.** The fast, easy way to find out what races and what horses should be looked at...all summarized in a "power rating" format. 129.00

**QUARTER HORSE HANDICAPPING.** the computer system actually "rates" the horses in each race of what is the fastest growing segment in the sport of kings. 129.00

**TRAINER STATISTICS.** Analyzes all local race-horse trainers and gives you a rating for each one. 39.95

**JOCKEY STATISTICS.** A short time with this software package will show you why the top 15 jockeys at local tracks win over 90% of all races. 39.95

**HARNESS DRIVER STATISTICS.** A complement to the HARNESS HORSE HANDICAPPING System, this package tells you all you need to know about the man (or woman) behind the horse. 39.95

ten by a nine year old. But, every time you get a program to do what you want it to, you're learning or creating a new technique that works for you. And eventually, you'll feel comfortable saying, "Yeah, I do a little programming now and then. Why? What are you working on? Maybe I can help."

By the way, I know there are loan programs in the public domain, but since I'm writing about programming I thought the least I could do was put something original in my column.

For the education of those who care, I'll try to explain what the program does and how it does it. For those of you who couldn't care less about programming, skip to the "Future Columns" header. Unless you need this program to figure out how much new car you can afford to buy and still make the payments! Or maybe you're looking for a new house?

Are you sure you're going to want that \$76,000 beauty when you find out that you'll pay \$177,609.97? That's \$101,609.97 in interest at 13.5% over 15 years, \$986.72 every month. The monthly payment comes down, but the interest doubles, if you extend the payments over 30 years.

My program takes the amount you plan to finance, the number of payments per year, the total number of payments, and the interest rate, and spits out the size of individual payments, the total amount you'll be paying back, and how much of that is interest. It will also print out a payment schedule showing the balance owed, the payment made, how much of that payment is interest, and how much applies toward the principal. This can be a long list when you're thinking about a 30-year mortgage.

As mentioned before, I don't use a very structured style. The opening lines identify the program. Then, a couple of GET statements are used to determine whether the screen or printer is used for output and whether the payback schedule is generated or not. (More on these later.) INPUT statements are then used to get the numbers to feed into the equations. The GOSUB to 1000 is an error trap to prevent using negative numbers. By taking the

absolute value, the negative is stripped off.

Lines 250 and 251 check to see if you want a printout and open a channel to the printer, if appropriate. Line 260 clears the monitor screen. I chose to have the PRINT statements reprise the information that has been entered, so that the upper section gives all the details; amount financed, interest rate, payments per year, and how many payments total.

By doing it this way, it's convenient to refer to them later. (Like when you're trying to convince your husband that you really can afford that new washing machine. You'll have to write your own program to show how the thing will pay for itself by saving on the laundry bill.) The printouts are also helpful when doing comparison shopping. One dealer may give you a better price, another a lower interest rate, and a third a longer term loan. Comparing the printouts may help you see which is the best deal and which deal you can afford.

Line 275 sends the amount financed figure off to be rounded by the routine at 2000, via line 4030. I had two other rounding routines, one a three liner, another six lines long. I chose this one because it's short, sweet, and it works. Lines 400 and 410 actually compute the individual payments and amount of interest paid over the life of the loan.

The subroutines at 3000 and 4000 take the active variables and reassign them to the variable B to be rounded by GOSUB 2000. When the result of the truncation comes back, it has to be reassigned to its old variable for printout.

Lines 600-640 give the results of the calculations. Line 690 checks to find out whether you want a loan schedule printed or not. If not, it sends execution to the END statement.

Lines 691, 695, and 697 calculate the values for the first line of the loan schedule. Lines 700 and 760 control the output format. Since the screen is only 40 characters wide and most printers are 80 characters wide, I set the program to print out in two different ways. Although the screen format would work with the printer, I wanted to take advantage of the printer's wider line length. (Add an extra three hours of programming time to get the printout right!)

The X variable is used to keep track of how many lines have been printed. The X2 variable tracks what page is printing. The first page has 50 lines of loan schedule, as the first 10 lines are used to print the loan information. The other pages have 60 lines. Lines 730 and 740 use the X variables to track the lines and pages that have been printed. CHR\$(127) is a form feed. When the printer receives one, it will page over the perforations between sheets of paper. (This assumes you're using a tractor feed printer.)

For those who use a printer that takes cut sheet paper and want a challenge, try writing in a couple of routines to pause at the end of pages. You'll need to use a routine that takes keyboard input to restart the printout.

Lines 750-753 are used to get the numbers lined up on the decimal point. Again, this is a borrowed routine someone else submitted to a magazine for others to use.

# presenting . . . **CAPTURE™**

## A NEW WAY TO UNLOCK THE POWER OF YOUR C64 OR C128\*

- **CAPTURE** IS A CARTRIDGE THAT PLUGS INTO YOUR COMPUTER'S EXPANSION PORT.
- **CAPTURE** DOES NOTHING — UNTIL YOU PRESS ITS **CAPTURE** BUTTON. UNTIL THEN, A RUNNING PROGRAM CANNOT DETECT ITS PRESENCE.
- **CAPTURE** THEN TAKES CONTROL — NO IFS, ANDS OR BUTS — AND PRESENTS A MENU.
- **CAPTURE** WILL NEATLY SAVE EVERYTHING IN YOUR COMPUTER TO YOUR 1541 OR COMPATIBLE DISK DRIVE — ALL 64K OF RAM, CPU, VIC AND SID CHIP REGISTERS — EVERYTHING. IN EASY TO VIEW CHUNKS.
- **CAPTURE** WILL, IF YOU WANT, PRE-CONFIGURE YOUR COMPUTER'S RAM SO THAT ONLY MEMORY ALTERED BY YOUR PROGRAM NEED BE SAVED.
- **CAPTURE** WILL WRITE A BOOT ON YOUR DISK SO YOU CAN RELOAD AND BEGIN EXECUTION RIGHT WHERE YOU LEFT OFF.
- **CAPTURE** DOES ALL THIS AT A COST OF JUST **\$39.95**

### BUT HERE'S THE BEST PART

- **CAPTURE** WILL MAKE AN AUTO-START CARTRIDGE OF YOUR PROGRAM. IT'S EASY! JUST FOLLOW THE DIRECTIONS ON THE SCREEN. NOW PLUG IN YOUR CARTRIDGE AND TURN ON YOUR COMPUTER. IN LESS THAN TWO SECONDS YOUR PROGRAM BEGINS AGAIN AT PRECISELY THE POINT WHERE YOU **CAPTURE'D** IT. MAGIC!
- BESIDES **CAPTURE**, YOU NEED A *promenade* C1 AND A SUPPLY OF CPR3 CARTRIDGE KITS.

### ORDERING INFORMATION

Next is a perfect example of sloppy programming. (One of those where a picky person would start getting critical and recommend a course in structured programming.) Line 770 duplicates the calculations performed by lines 691, 695, and 697. A structured programmer would have stuck them in a subroutine at the end. But I didn't realize I would need them more than once until I started working out the page formatting. And I was too lazy to rewrite eight lines of code. (Doesn't that make you feel better? Just to know that someone else is lazy, too?)

820 tidies up the loose ends at the bottom of the print-out. (After all, the one payment at the end usually turns out to be less than the rest.) 825 checks to see if the schedule is complete. If so, it ends the program. Otherwise, the program loops back to print the next line of the table.

That's it, folks. It isn't pretty. It isn't fancy. It just works!

There is usually a hidden point to my meanderings. The obvious purpose of this exercise was to show a little bit about BASIC programming. But the covert messages are that anyone can program, you don't have to be a perfectionist, and you learn by doing.

Many programs you see in magazines look so clean and neat and tidy because they've been done by someone who has been programming for quite a while. (Or they've been edited by someone equally adept.) But programs don't have to be pretty to be functional. And when you first start programming, the results aren't likely to be pretty. (Actually, they probably won't be functional either!) With practice, though, the pieces start to fall into place.

Once you've decided to jump into programming, there are a few aids that can make it go faster. *Ahoy!* has already published a program that generates line numbers for you and another that rennumbers them. Though there are extended versions of BASIC available, beginners should probably stick with the basic BASIC until they've gotten a bit more experience.

Two commercial programs will help speed things up for you: *XREF 64* and *BASIC 64* from Abacus Software.

*X-REF 64* is an inexpensive little program that analyzes your program and prints a list of all keywords, functions, and variables used. It gives a nicely formatted, paginated listing of all the numerical values, variables, and BASIC keywords, as well as the lines in which they appear.

When programming in BASIC, it is often difficult to remember just where everything is in a program. If the program doesn't have comments identifying sections where specific processes take place, it is especially tough. Most programmers use variable names that correspond to the functions or ideas represented by the variables. While this helps make deciphering printouts easier, trying to find a given variable in an 800-line program is like trying to find a dime in a pile of nickels. When you have a listing of all the variables and the lines in which each appears, it's easier.

Complaints that BASIC programs run slowly are well founded, and when you can buy an inexpensive compiler that will improve the speed at which your programs run, it's a shame not to have one. *BASIC 64* is such a

program. Depending on how often you use a program you've found or written, it may or may not be worth compiling. A long program can take up to 30 minutes to compile, but once compiled it will run much faster. The compiler won't speed up output to the screen or to a printer or modem. It will speed up internal calculations and processing that the computer does.

*Castle*, one of my favorite public domain games, takes a couple of minutes to assign variables and manipulate data when the game starts. Of course, it displays a short text explanation of the game while it is doing all this, but the wait is annoying. Enter *BASIC 64*. It took about 20 minutes to compile *Castle* and now the initialization wait is only about 15 seconds. Although there is a noticeable improvement in the opening segment, the screen display is still slow since BASIC doesn't use direct screen addressing.

I should mention that *Castle* was originally written for a TRS-80 computer running MicroSoft BASIC. I originally downloaded it from a public BBS with my Osborne 1 computer (the machine I used before I got my Commodore). It required only small modifications to run. I later used the Commodore RS232 module and a null-modem (direct connect) cable to transmit *Castle* to the Commodore as an ASCII file. After using *TX2BAS* to convert it to a PRG file, I was able to modify it to run on the Commodore. Although all three machines run MicroSoft BASIC, each version is slightly different (just as BASIC 7.0 for the 128 is different from the 4.0 than runs on the 64).

#### WHO WILL BENEFIT FROM BASIC 64?

For those who find BASIC programs that they use consistently, *BASIC 64* would be a great asset. It's surprisingly easy to use. The documentation is concise; simple explanations for the simple features. Although the program has advanced features that more experienced programmers will find useful, it is designed to be usable by programmers of any experience level. Using the advanced features, assembly language routines can be included and modules can be strung together.

The resulting compiled programs usually take up just as much (if not more) disk space, but the speed makes up for it. While other compilers cost close to \$100, *BASIC 64* costs \$39.95. And as you get more heavily into programming, it expands to suit you.

*BASIC 64* is available for \$39.95 and *X-REF* for \$17.95 from Abacus Software, P.O. Box 7211, Grand Rapids, MI 49510 (phone: 616-241-5510).

#### FUTURE COLUMNS

If any of you have a particular topic you'd like to hear more about, please write me in care of *Ahoy!* All your letters will be forwarded to me, here in Miami. For any of you who'd like to contact me via CompuServe, my user number is 72366,2645. Since I'm only an occasional visitor to the CBM SIG's, EasyPlex is the best way to get in touch. □

# COMMODORES

## PROGRAMMING CHALLENGES

By Dale Rupert

**E**ach month, we'll present several challenges designed to stimulate your synapses and toggle the bits in your cerebral random access memory. We invite you to send your solutions to:

*Commodares, c/o Ahoy!*  
P.O. Box 723  
Bethel, CT 06801

We will print and discuss the cleverest, simplest, shortest, most interesting and/or most unusual solutions. Be sure to identify the *Name* and *Number* of the problems you are solving. Also show sample runs if possible, where appropriate. Be sure to tell what makes your solutions unique or interesting, if they are.

Programs on diskette are welcome, but they must be accompanied by listings. You must enclose a stamped, self-addressed envelope if you want any of your materials returned. Solutions received by the middle of the month shown on the magazine cover are most likely to be discussed, but you may send solutions and comments any time. Your original programming problems, suggestions, and ideas are equally welcome. The best ones will become *Commodares!*

### PROBLEM #23-1: EDGE WEDGE

This problem was submitted by Charles Grady (Cleveland, TN). The user inputs a string. The computer prints the string as a wedge against the right side of the screen. An example gives the details: if the input is "A TEST", the output is

```
T
ST
EST
TEST
TEST
A TEST
```

One restriction—no cursor arrow keys are allowed. The output should be displayable on the screen or on a printer.

### PROBLEM #23-2: ROOTING ROUTINE

Allan Flippin (San Jose, CA) suggested this problem for the mathematically inclined. The user inputs a number between 1 and 65535. The computer displays the square root of the number to the nearest whole number. Of course there's a catch. The routine must be in BASIC and must use only +, -, /, \*, and relational operators (no BASIC functions such as SQR or LOG). Dig out those algorithm books.

### PROBLEM #23-3: SPEEDY BUG

This classic problem suggested by James Borden (Carlisle, PA) should make a good *Commodare*. Two trains head toward each other on the same track. Train A goes 62.5 mi/hr and Train B goes 37.5 mi/hr. The trains are 800 miles apart when a fast bug leaves Train A, flies to Train B, immediately turns around and flies back to Train A, whereupon it instantly turns and returns to Train B, et cetera ad infinitum, or at least until the trains meet, smashing the bug between them. (Please substitute a less violent scenario if you prefer.) How far does the bug fly?

Already some of you are writing down the answer and preparing to send it to us, but wait. What we want here is a computer simulation, not just the right answer. Pretend that the answer is not easy to calculate (of course it is if you know how), and let the computer figure it out. (Any graphically animated solutions should be sent on tape or disk.)

### PROBLEM #23-4: TYPING TUTOR

The computer displays a sentence. The user types the sentence. The computer then displays the number of errors the user made and the amount of time in jiffies it took to type the sentence. Nothing too difficult or tricky here. Let's see some solutions from you first-time programmers.

This month we will look at readers' solutions to *Commodares* from the July issue of *Ahoy!* There are a few other items of business to handle as well. First a special word of thanks to the readers from other countries who sent solutions and letters to *Commodares*. In addition to the Canadian readers mentioned later, we have received "international solutions" to various problems from Yilmaz Atila (Izmir, Turkey), Christian Leyer (Quakenbrueck, Federal Republic of Germany), and Ricardo Chan (Panama City, Panama). Readers in other countries should feel free to write, whether you have solutions to *Commodares* or not. It is a pleasure to hear from all of you.

Tony Ruperto (Kitimat, BC, Canada) succinctly answered the question posed in a previous *Commodares* column as to when a space is mandatory in a BASIC program. He states that the only time a space is needed is when the combination of two words or letters make up a third which is a reserved word or another BASIC keyword. For example, A=TANDI28 requires a space between the T and the AND or else the computer will

assume that the tangent function is desired and give a syntax error. Bugs like that can be quite puzzling at first.

Joseph Taylor (Jenison, MI) was the first to send the translation of the cryptogram listed at the end of the August *Commodores*. Joseph solved it without help of a computer in 45 seconds. It was a one-letter displacement code where "ABC..." were replaced by "BCD...". I would still like to hear from someone who has a program to help arrive at the result based on standard letter frequencies. This is a difficult problem with such a small sample of encoded text, but it might be fun to try.

In response to the challenge for a significant-digit rounding function, Michael Skloff (New York, NY) sent the following:

```
DEF FNL(N)=INT(LOG(ABS(N))/LOG(10))
DEF FNS(X)=INT(N*10^(X-FNL(N)-1)+.5)*10^
(FNL(N)-X+1)
```

These functions properly round the number N to X significant digits. The first function calculates the base-10 logarithm of N. This is used to gauge the size of N. The second function performs the actual rounding. The 80-character line limit is the only reason for having two functions. The variable N must store the number to be rounded. Then PRINT FNS(3) will display the value of N rounded to 3 significant figures. (Unfortunately 1.235E+15 rounded to 3 significant figures resulted in 1.23E+15 instead of 1.24E+15, but perhaps that is because of the internal storage of the values. Can any readers provide further insight into this problem?) Thanks to Michael for these functions.

Thanks also to Scott Duncan (Superior, NE) and John R. Prager (Bay City, MI) for detailed analyses of the "N elements printed in C columns" problem presented in *Commodores #19-1* in the July issue. John Prager summarizes the situation as follows: assume that R is the remainder when N is divided by C. If R is greater than zero but less than C-1, it is not possible to display N numbers in C columns as described in the problem. If anyone is interested in the proofs, send a self-addressed stamped envelope to *Commodores* at the above address.

One final tidbit before looking at July's problems. Charles Grady (Cleveland, TN) sent the following program in response to the cycling function challenge (*Problem #18-1*):

```
10 FOR I=0 TO 100 STEP 5:GOTO 30
20 FOR L=95 TO 5 STEP -5:GOTO 40
30 PRINT I:NEXT I:GOTO 20
40 PRINT L:NEXT L:GOTO 10
```

First let me say that the program works as advertised on the Commodore 64. The reason I have listed the program is that before I entered it into the computer and ran it, I would have sworn that it wouldn't work. Do you know why? (Study it for a moment if you are a long-time BASIC programmer.)

Back in the old days, rule number one regarding nested FOR-NEXT loops was that they must not overlap. It is

okay for one loop to be contained completely within another, but the inner loop must not meander outside of the outer loop as in this example. Well, so much for the old days. The C-64 handles this program without any trouble. Out of curiosity, I tried the program on an IBM PC. It gave a "NEXT without FOR in line 40" error before it reached line 20. If any of you have other computers to try this on, let me know your results. How about the C-64 BASIC Compiler? What happens if you use the NEXT statements without variables? Thanks to Charles for an interesting problem.

Now on to July's *Commodores*. *Problem #19-1: Binary Palindrome* brought dozens of responses. There were several significantly different categories of solutions. For a binary number to be a palindrome, it must be a sum of one or more of the following values: 129, 66, 36, and 24. This is easily seen by writing the binary values for those numbers. Each number contains two symmetrically placed ones. The solution from Mark Tillotson (Tulsa, OK) typifies the approach that looks for such terms within a given number.

```
1 REM
2 REM PROBLEM #19-1:
3 REM   BINARY PALINDROME
4 REM BY MARK TILLOTSON
5 REM
10 INPUT"VALUE";N:IF N<0 OR N>255THEN10
20 IF N>=129 THEN N=N-129
30 IF N>=66 THEN N=N-66
40 IF N>=36 THEN N=N-36
50 IF N>=24 THEN N=N-24
60 IF N=0 THEN PRINT"YES":PRINT:GOTO 10
70 PRINT"NO":PRINT:GOTO 10
```

Mark's trial subtraction essentially "crosses out" symmetrical pairs of ones in the binary representation of the given number. If anything is left over, line 70 concludes that the number does not have a binary palindrome.

Another approach to this problem is to perform bit-by-bit analysis on the given number. If the number is a palindrome, the seventh bit must match the zeroth bit, bits six and one must match, and so forth. Most solutions using this approach contained statements such as

```
IF (N AND 64)/64 <> (N AND 2)/2 THEN (NO
PALINDROME)
```

or

```

```

20 IF N<0 OR N>255 THEN END
30 IF SGN(N AND 128) <> SGN(N AND 1) THEN
N 80
40 IF SGN(NAND64)<>SGN(NAND2) THEN 80
50 IF SGN(NAND32)<>SGN(NAND4) THEN 80
60 IF SGN(NAND16)<>SGN(NAND8) THEN 80
70 PRINT"PALINDROME":GOTO 10
80 PRINT"NOT A PALINDROME":GOTO 10

```

Notice Patti's use of the oft-forgotten SGN function. The result of each AND operation will be either zero or positive. Both AND operations on each line must agree if the number is a palindrome. The SGN function returns the value one if the result is positive and zero if it is zero. No more information is needed to determine the palindromicity (to coin a word) of the number.

Jim Speers (Niles, MI) took the problem a step further to find all 16-bit binary palindromes. Problems occur when dealing with negative numbers. Readers up for an additional challenge might give it a try.

The solution to *Problem #19-2: Memory Locator* from John R. Prager (Bay City, MI) is listed below.

```

1 REM
2 REM PROBLEM #19-2:
3 REM MEMORY LOCATOR
4 REM BY JOHN R. PRAGER
5 REM
50 A$(8)="HELLO" + " THERE!" :REM DEMO
60 REM
100 DEF FNM(X)=PEEK(X)+PEEK(X+1)*256
110 PRINT"PROGRAM TEXT:" FNM(43) "TO" FNM(45)-1
120 PRINT"VARIABLES:" FNM(45) "TO" FNM(47)-1
130 PRINT"ARRAYS:" FNM(47) "TO" FNM(49)
140 PRINT"STRING STORAGE:" FNM(51) "TO" FNM(55)

```

Line 50 of John's program demonstrates that the string concatenation causes the computer to use a temporary storage area for the string values. If the "+" and the second string literal were not on line 50, a separate string storage area would not be used.

James Borden (Carlisle, PA) wrote his solution to this problem as a subroutine. You might do the same to see how the storage areas change as your program is executed.

I suggest that you add some FOR-NEXT loops to PEEK into the storage areas to see how the various variables are stored. You might also refer back to the April, May, and December 1984 editions of the *Rupert Report* for some further clues about the inner workings of BASIC. Why is so much variable space used in John's program when there aren't any non-array variables?

Of the numerous solutions to *Problem #19-3: Orthogonal Time*, William Lott's (Coventry, CT) was the easiest to understand.

```

1 REM
2 REM PROBLEM #19-3:
3 REM ORTHOGONAL TIME

```

```

4 REM BY WILLIAM LOTT
5 REM
10 PRINT"+" : X=5400 : GOSUB 1000
20 X=X+10800 : GOSUB 1000 : GOTO 20
1000 S=X/5.5:Y=INT(S):Z=S-Y:IF Z>.5 THEN
Y=Y+1
1010 IF Y>43200 THEN END
1020 H=INT(Y/3600):M=INT((Y-H*3600)/60):
SEC=Y-H*3600-M*60
1030 PRINT"hour="H,"min="M,"sec="SEC:RET
URN

```

In order to find the times at which the hands of the clock form right angles, William uses the fact that the minute hand gains 5.5 (angular) minutes on the hour hand every second. This follows from the fact that the hour hand moves half an (angular) minute every second, and the minute hand moves six (angular) minutes every second.

The program starts at 12 o'clock (0 degrees between the hands) and determines the time at which the minute hand has gained 5400 (angular) minutes (90 degrees) on the hour hand. Every other occurrence of a 90 degree angle is 180 degrees (10800 angular minutes) after the previous occurrence. The subroutine at line 1000 converts angular minutes into hours, minutes, and seconds.

Those of you familiar with the concepts of relativity will recognize that this program uses the hour hand of the clock as a reference frame. The calculations are much simpler if the face of the clock is used as the frame of reference.

A program using a similar approach but written in COMAL by Ray Carter (Las Cruces, MN) is listed here for comparison.

```

# Aquarian Software Introduces . . .

## I.E.A. Instant Editor Assembler for the Commodore 64

- \* Written 100% in machine language
- \* Assembles 17K source code in 5 seconds!
- \* Co-resident editor assembler monitor
- \* Compatible with HES MON.
- \* Slow-motion code analyzer
- \* Technical assistance number

"I would have to recommend the IEA Instant Editor Assembler, the BEST VALUE-FOR-PRICE development package on the market!"

*Jim Gracely*  
Technical Editor  
*Commodore Microcomputer Magazine*

"IEA is a nice, simple assembler, good for beginners at an UNBELIEVABLE PRICE!"

*Jim Butterfield*  
"...Should be called the POOR MAN'S MERLIN — a great assembler, and you can't beat the price!"  
*William B. Sanders*  
Author of *Assembly Language For Kids*

**Now Only \$17.95**

## FAST BOOT

Now Available!  
Mike J. Henry's

"FAST BOOT!"

The ONLY Fast Booter that works with Both 1541 and MSD Drives!

Relocatable in memory.

Disk Based & Non-Protected

**Only \$14.95**

## TURBO CALC/64

A Great Beginner's Spreadsheet  
At an UNBELIEVABLE Price!!

- 100% Memory Resident
- 100% Machine Code and P-Code
- 100% Menu Driven
- Over 13 K RAM for Data
- Large Matrix, 100 Rows by 26 Columns
- On-Line Help Screens
- On-Screen Menu at All Times
- Full Printer Support
- Built-in Functions (SUM, AVG, MIN, MAX)

At last, a powerful, yet affordable spreadsheet!

**ONLY \$17.95**

## Nova Decoder 64

Version 3.0

A 6502/6510 Disassembler  
Designed for the Commodore User

A MUST for anyone just learning Machine Language.

A TREAT for those examining the operation of the C-64.

A BLESSING to machine language programmers trying to de-bug their programs.

- \* Choose Screen or Printer Options
- \* Addresses Printed in Either Hex or Decimal
- \* Complete Calculations of Branch Commands
- \* Brief Explanations of Each Command Encountered
- \* Generates Tables of Zero Page Addresses Used, Branch Addresses, All Jump Routines, and More . . .

**Only \$19.95**

## The Cataloger

The Ultimate Disk Cataloging  
System for the 64!

Will find any program instantly. Tells exactly which disk number the program is on, the disk name, disk ID, front or back of disk, category (games, utility, music, etc.). If the disk is protected (if so, what errors), the date the program was entered, the block count, and any comments concerning that program. Sort and print a list by any of 12 different fields.

Features of The Cataloger V3.5A Include:

- \* Easy loading of information. Loads directly from the disk itself.
- \* Ability to change name of entry.
- \* Ability to change any information instantly — uses relative files exclusively.
- \* Search, Sort and Print by any of 12 fields.
- \* Capacity for 1100 different programs (or disks) per data disk.
- \* FAST — all machine language.
- \* Menu driven — very easy to use.
- \* Works with ALL printers.
- \* Works with one or two drives.
- \* Allows duplicate ID's.
- \* Allows selection of items to be entered.
- \* Unlimited category names.

**Only \$24.95**

## Modem Master

The Fastest Commodore  
BBS Available!

- Works with 1541 or MSD Dual Drive
- 300/1200 Baud Operation
- New Punter File Transfer Protocol
- Fully Menu Driven
- Over 25 Commands
- Public Message Base
- Private E-Mail Base
- E-Mail Check at Sign-On
- Sub-Directories for File Transfer
- 250 User Capacity
- Accurate Clock/Calendar
- Printer Output
- Information Files
- "Old" E-Mail Deleted After One Week
- User Survey/Poll
- Set Up in Only 10 Minutes!

**Only \$29.95**

## Omiterm Terminal

- Fully supports the new 1660 Modem 300!
- Punter protocol — upload & download — 300/1200 baud
- Ten programmable function keys
- 15 number phone directory
- 20k receive buffer
- Tone or pulse dialing
- Auto dial redial
- Half/full duplex

**Only \$19.95**

```

The program structures and functions available in this language can make most of us "bare-bones BASIC" programmers somewhat envious. The program flow should be fairly obvious even to programmers that have not used COMAL. The rates defined in this program are in angular minutes per second. The minutes on the clock face are six angular minutes apart, and the minute hand travels six angular minutes in six seconds or 0.1 angular minute per second. (1 angular degree = 60 angular minutes.)

The final problem this month left a few readers somewhat frustrated. *Problem #19-4: Screen Scramble* did not prescribe how to handle the fact that a 40 by 25 screen cannot simply be rotated into a 25 by 40 area. Such details were left to the programmer's creativity. Both solutions listed below chopped off the screen at the 25th column and gave it a 90 degree clockwise rotation. There is one significant difference between the ways they did it, though.

The solution from Allan Flippin (San Jose, CA) actually rotates each character 90 degrees. After you run his program, you may stand your monitor on its side and see the original screen appearance!

A discussion of Allan's program is too lengthy for this column. If you want a copy of his source listing and remarks, send a self-addressed stamped envelope to *Commodares* with your request and I will send it to you. Basically Allan takes each character's bit map from ROM, rotates it, and puts it onto the screen at the new location. Anyone interested in having some serious programming done might do well to check with Allan.

The program from Bob Martin (West Lafayette, IN) involves some fancy work as well. The screen characters are printed from top to bottom starting at the upper right corner of the screen.

# ERRATA

## FASTNEW

An earlier version of *Fastnew*, which *does* bang the R/W head against the stop, accidentally saw print. In order to upgrade the published version of the program to the no-bang version, follow these steps:

Load in *Fastnew* as published. Replace lines 12 and 50 with the following:

```
12 REM          V0316/85
50 FOR I=0 TO 509:READ A:POKE I+9472,A
```

In line 1007, change the string V010585 to V031685. Replace the following lines as listed below.

```
5010 DATA 28,165,34,133,74,198,74,32
5020 DATA 212,6,198,74,208,249,162,0,32,
219
5040 DATA 36,240,12,32,72,5,48,7
5050 DATA 230,34,32,202,6,240,238,173
5270 DATA 141,3,28,32,245,6,169,0
5440 DATA 133,77,32,178,6,162,10,80
5470 DATA 105,10,133,48,76,134,6,169
5480 DATA 244,133,75,96,32,178,6,160
5570 DATA 32,205,6,174,0,28,232,76
5580 DATA 219,6,32,215,6,174,0,28
5630 DATA 160,32,208,240
```

Also lines 60000, 60001, 62000-62004 can all be deleted. They were useful during development of the program but are no longer needed.

## AHOY! DOCK

Lines 1070, 1110 and 9520 each contained a GOSUB that had misprinted and was spelled GOSUSB. Ignore the extra S. Line 9550 was also misprinted. That line should read:

```
9550 F=.:FORJ=1TOC-1
```

## START & END FILE ADDRESS

Due to an error in our listing generator program, line 10 is incorrect. It should read:

```
10 Q=24:P=Q*256:S=INT(P/256)
```

## SOLITAIRE 64

Lines 6 and 7 contain a [008] within quotes. It should be replaced in each line by CNTRL H inside the quote marks.

## Program Your Own EPROMS

VIC 20  
C 64 **\$99.50**

PLUGS INTO USER PORT.  
NOTHING ELSE NEEDED.  
EASY TO USE. VERSATILE.

- Read or Program. One byte or 32K bytes!

OR Use like a disk drive. LOAD, SAVE, GET, INPUT, PRINT, CMD, OPEN, CLOSE—**EPROM FILES!**

Our software lets you use familiar BASIC commands to create, modify, scratch files on readily available EPROM chips. Adds a new dimension to your computing capability. Works with most ML Monitors too.

- Make Auto-Start Cartridges of your programs.
- The *promenade*™ C1 gives you 4 programming voltages, 2 EPROM supply voltages, 3 intelligent programming algorithms, 15 bit chip addressing, 3 LED's and NO switches. Your computer controls everything from software!
- Textool socket. Anti-static aluminum housing.
- EPROMS, cartridge PC boards, etc. at extra charge.

- Some EPROM types you can use with the *promenade*™

## PROFESSIONAL HANDICAPPING SYSTEMS

• PRESENTED BY PROFESSOR JONES •

### GLD. Thoroughbred "Gold" Edition™

A "Full" featured thoroughbred analysis designed for the professional and the serious novice. **\$159.95** complete

### EGLD. Enhanced "Gold" Edition™

"Gold" Edition with complete Master Bettor™ system integrated onto the same disk. This powerful program will transfer all horses and scores to the bet analysis with a "single keystroke." (Master Bettor™ included) **\$199.95** complete

### GLTD. Limited "Gold"™

Enables Professional Handicappers to assign specific values to the racing variables "they" feel are important. Create program weight based on a particular track and fine tune it for **maximum** win percentage. This program is designed for "ease of use." The user needs **no programming experience.** (contains Integrated Bettor™) **\$299.95** complete

### GD. Gold Dog Analysis™

The "ONLY" professional greyhound analysis available that evaluates ALL variables. **\$149.95** w/integrated Bettor **\$199.95** Limited Version **\$299.95**

### MHH. Master Harness Handicapper™

Professional software designed to provide a thorough analysis of all trotter and pacer races in North America and Canada. **\$159.95** complete **\$199.95** w/integrated Bettor Limited **\$299.95**

### Professor Pix Football™

Complete STATISTICAL ANALYSIS on Data Base allowing "Designed" previous games to be evaluated. **\$99.95** Statistical Series **\$99.95** w/Win-Loss Power Ratings **\$149.95**

### NBA. Basketball™

NBA **\$99.95** w/college **\$129.95** w/power ratings **\$149.95**

### LOT. Lottery Analysis™

Statistical comparison program designed to detect subtle patterns in winning numbers and digits. **\$79.95** Lottery (3-4 digit) **\$79.95** w/Lotto (Max. 99 Digit) **\$99.95**

**PC-3 Portable Computer (4k)** with choice of Thoroughbred, Greyhound or Trotter™ **\$249.95** (includes portable computer and program.)

**M-100 Portable (24k)** w/choice of Thoroughbred, Greyhound, or Trotter™ **\$649.95** (includes portable computer and program.)

# Now Commodore giant leap forward

---

**Introducing Viewtron.**  
The new service that's  
easier to use, and faster  
to operate. At a price  
you may never see again.

---

Viewtron represents the newest, most advanced generation of on-line services. And it's less expensive to buy, less expensive to use. It's a complete service that includes information, shopping, home banking, messaging, air fares, schedules, and much more.

Viewtron is so much easier to use than other services because its sophisticated navigational structure uses everyday English keywords rather than arbitrary meaningless codes. Our system makes it faster getting around. So it saves you time. *And that saves you money.*

For instance, just type "stocks," "encyclopedia," or "news" when you want the latest stock market data, educational material, or up-to-the-minute news. You can even create your own keywords.

**A single button can  
get you what you need.**

With the touch of one button, you access a keyword file that lets you quickly review information which is particularly important to you. Like the current price of your securities, or your favorite team's stats and scores, or news in your career field.

**Special services exclusively  
for Commodore owners.**

Viewtron lets you "Ask the Experts" for answers to Commodore questions. Or order bargains on hot-selling Commodore software. And you can bid on software and hardware in our electronic

auction, where prices keep dropping instead of rising. Plus you get other services like Commodore software reviews. With Viewtron, you can also download free software.

What's more, Viewtron is the only complete on-line service that runs in color on Commodore machines.

**Pay only for what you use.**

Viewtron charges no subscription fee and no monthly minimum. You pay only for what you use. Just 9 cents a minute weekday nights (after 6 pm) and weekends; 22 cents a minute weekdays.\* And unlike other services, we don't charge extra if you use a 1200-baud modem.

You can access Viewtron on any of three communications networks, UNINET<sup>®</sup>, GTE Telenet<sup>®</sup>, or TYMNET<sup>®</sup> (A local call for most people.)

ABBY'S CARRIES A FULL SELECTION OF SOFTWARE FOR YOUR COMMODORE COMPUTER. CALL FOR CURRENT PRICES.

# CHOPPER FLIGHT FOR THE C-64

BY MIKE BUHIDAR, JR. AND KEVIN WORAM

In *Chopper Flight*, you are a civilian helicopter pilot who has been called upon by his country to fly a rescue mission. A group of ruthless terrorists have captured two adjacent apartment buildings in your city and are holding all the tenants hostage. If their demands are not met in one hour, they threaten to blow up the building, killing themselves and all of the inhabitants. The nearest military helicopter base is too far away to send help in time, so you have been asked to use your own personal chopper to rescue the hostages. However, the terrorists don't appreciate your sense of duty and they start to fire anti-aircraft shells at you. Shortly before a shell is fired, you will hear a warning noise. If you hurry, you can guide your chopper onto a ledge where you will have some measure of safety. When the terrorists realize that you could ruin their plans, they send for a heat-seeking missile which automatically homes in on your chopper. However, before the missile is fired, the border of the screen will turn orange and then red. This is a warning that your time is almost up.

As the game begins, you are asked to enter the difficulty of the mission. The skill level ranges from one to six, one being the easiest, six being the hardest. The height of the building and the amount of time before the heat-seeking missile is fired depend on the skill level you select. Also, your maneuverability varies with the difficulty of your mission.

To maneuver your chopper, use a joystick plugged into

control port 2. To control your rate of descent, hold down the fire button on your controller. After a short period of holding down the button, your helicopter will begin to hover. At this point you can maneuver your craft between the ledges to rescue the hostages. Releasing the fire button will cause the chopper to begin descending again. Movement in all eight directions is possible. However, do not try to move your chopper off the top or bottom of the screen; once a section of the building has scrolled off the top of the screen, it is gone and you cannot go back to it. Likewise, the only way to descend to the lower parts of the building is to allow your chopper to drop by releasing the fire button.

On every fourth floor of one of the buildings, you will see a hostage standing on a ledge. To save him, slow your chopper's downward fall to a hover and maneuver your chopper between the ledges. As soon as you touch the hostage, he is replaced by a heart symbol to show that he is safely on board. If you allow a hostage to scroll off the top of the screen, he is beyond help and you cannot save him.

If you are able to reach the bottom without crashing into the building, being hit by a shell, or running out of time, you will receive one hundred points for every man you have rescued. Also, extra points are awarded for the difficulty of your mission and for completing it in the least amount of time. □

## SYMBOL MASTER™

### MULTI-PASS SYMBOLIC DISASSEMBLER FOR COMMODORE 64\* & 128\*

(Includes C-128 native 8502 mode)  
disassembles any  
6502/6510/8502 machine code  
program into beautiful source

- Learn to program like the experts!
- Adapt existing programs to your needs!
- Automatic LABEL generation.
- Outputs source code files to disk fully compatible with your MAE,\* PAL,\* CBM,\* Develop-64,\* LADS\* or Merlin\* assembler, ready for re-assembly and editing!
- Outputs formatted listing to screen and printer.
- Automatically uses NAMES of Kernal jump table routines and all operating system variables.
- Disassembles programs regardless of load address. Easily handles autorun "Boot" programs.
- Generates list of equates for external addresses.
- Generates complete cross-referenced symbol table.
- Recognizes instructions hidden under BIT instructions.
- 100% machine code for speed. Not copy protected.

**ORDER NOW!** \$49.95 postpaid USA. Disk only.

\*MAE is a trademark of Eastern House. PAL is a trademark of Pro-Line. Commodore 64 & 128 are trademarks and CBM is a registered trademark of Commodore. Develop-64 is a trademark of French Silk. LADS is a trademark of Compute! Publications. Merlin is a trademark of Roger Wagner Publishing.

### UNLEASH THE POWER OF YOUR COMMODORE 64 WITH THE ULTIMATE INTERFACE

- Control and monitor your home—appliances, lights and security system
  - Intelligently control almost any device
  - Connect to Analog-to-Digital Conversions
  - Control Robots
  - Perform automated testing
  - Acquire data for laboratory and other instrumentation applications
  - Many other uses
- Don't make the mistake of buying a limited capability interface. Investigate our universally applicable Dual 6522 Versatile Interface Adapter (VIA) Board, which plugs into the expansion connector and provides:
- Four 8-bit fully bidirectional I/O ports & eight handshake lines
  - Four 16 bit timer/counters
  - Full IRQ interrupt capability
  - Four convenient 16-pin DIP socket interface connections
  - Expandability up to four boards & sixteen ports.
- ORDER NOW!** Price \$169, postpaid USA. Extensive documentation included. Each additional board \$149.

## COMMODORE 64™ SOURCE CODE!

### "What's Really Inside the Commodore 64"

• Most complete available reconstructed assembly language source code for the C-64's Basic and Kernal ROMs, all 16K. • You will fully understand calls to undocumented ROM routines, and be able to effectively use them in your own programs. • Uses LABELS. Not a mere one-line disassembly. All branch targets and subroutine entry points are shown. • TABLES are fully sorted out and derived. • Completely commented, no gaps whatsoever. You will see and understand the purpose of every routine and every line of code! • Complete listing of equates to external label references. • Invaluable fully cross-referenced symbol table. Order C-64 Source. \$29.95 postpaid USA.

### PROFESSIONAL UTILITIES:

We personally use and highly recommend these two:

- PTD6510 Symbolic Debugger for C-64. An extremely powerful tool with capabilities far beyond a machine-language monitor. \$49.95 postpaid USA.
- MAE64. Fully professional macro editor/assembler. \$39.95 postpaid USA.

All orders shipped from stock within 24 hours via UPS. VISA/MasterCard welcomed.  
There will be a delay of 15 working days on orders paid by personal check.

AHOY! 117

# FLOTSAM

*Cheryl Peterson's guest editorial in the August Ahoy!, concerning software piracy and its effect on the home computer industry, has drawn a wave of responses from both sides of the gangplank. A sampling is presented in this month's edition of Flotsam.*

Congratulations to Cheryl Peterson for her excellent guest editorial in the August issue of *Ahoy!* What she had to say about stealing programs is, I am afraid, all too true. As a teacher I have contact with a considerable number of students who use or would like to learn how to use computers. I have frequently been asked by students to make, or show them how to make, copies of copyrighted software. Many of these students, and other friends, think that there is nothing wrong with "sharing" special programs. I am amazed at the number of people who really don't understand that pirating software is a crime. I recently asked one young hacker if he would go into a local computer shop and walk out with a program under his jacket. He was shocked when I told him that making a copy of my *Print Shop* would be the same as taking it from the store.

A real challenge exists here for people who write for *Ahoy!*, or any of the other fine computer magazines, and teachers like myself, to educate computer users about the law and everyone's responsibility to respect the rights of others.

—Robert H. Crosswell  
Trappe, MD

To get straight to the point, I am a pirate. I have purchased programs at near full retail with absolutely no regret as to the price. The documentation was by itself well worth the money. I have better than one thousand pirated programs that I have traded for or copied using commercial copiers (most which were pirated themselves) or, using a machine language monitor, de-protected and copied. Several friends of mine and I trade programs between one another and have access to several networks that we can trade with. Several days ago I received 57 disks from our source in the midwest and another 35 from our west coast source. Some of these disks have as many as 6 complete programs. I am 39 years old and the average age of our group is 45, with members as young as 12. We are not in this for the profit, but rather as a means to build inexpensive libraries.

I have several suggestions that I would like to discuss with you. First of all, I wish to make an analogy to the record industry. A rock group spends as much as \$250,000 to cut an album. Then they spend a tremendous amount of time and money promoting the album. The finished product is presented to the public for between \$6 and \$10. I think this is reasonable, and I have an extensive LP library to back this up. I could tape albums

from my friends, but rarely want the entire album on one tape. The price is affordable, so I purchase what I want, and tape from that what I wish to listen to. The software industry, on the other hand, purchases many of its programs from pirate developers. They should not have any more expenses involved than does the record industry, but charge 3 to 10 times more for a program. Business programs require extensive documentation and I consider the price fair with all considerations. (If you own an IBM PC or equivalent, you get to pay a surcharge for the privilege of owning that brand.) Game programs, on the other hand, are sometimes of very poor quality and barely worth the price of a blank disk, much less \$30. A lot of the time a person buys blindly, as most store clerks have trouble finding the price much less knowing anything about the content.

My solution is simple. Dongle protect the programs and keep the price around the \$10 range for games, and under \$50 for business programs. If the software industry is so greedy as to try to make their millions overnight, then they have to deal with the threat that people will steal their programs and give them away free as we do. A fair deal is a two way street. It must be profitable and affordable at the same time. Whatever happened to worth and value?

—Dave, a Pirate  
Spokane, WA

To point the finger of guilt at the pirates and the home users who accept pirated software is legally fair, but ethically limited and based on naiveté. Let's point the finger at the real culprit, POPULAR COMPUTER MAGAZINES which advertise, for profit, "copy-all" programs. In the same issue of *Ahoy!* in which Cheryl's editorial appeared, I quickly found five (5) advertisements for disk copy-all programs, and two (2) advertisements for cartridge copiers. Isn't this the real nightmare? This practice is really setting the stage for and actively promoting the practice of piracy! How can a publisher justify running advertisements for expensive commercial software on one page and on the other page run advertisements for copy-all programs which will copy and pirate the commercial software on the previous page? The publishers will justify their actions by saying, "There is nothing wrong with advertising legitimate backup utilities!" However, software producers sell backup copies of their software at very reasonable costs.

So, Cheryl, let's shift the guilt from the bored and inquisitive pirate to the medium which has supplied the pirate with his tools. Hindsight is so clear...If computer magazine publishers had exercised better judgment a few years ago perhaps your "nightmare" would only be a mild concern and the home market would still be expanding.

—Richard N. Dawson  
Marysville, MI

I refuse to make or accept copies of commercial programs. My position is based upon knowledge of the effort, time, and money involved in developing software. Regrettably, the stealing, and it is stealing, is just one more example of the 'take care of number one' attitude so prevalent these days. What I'm trying to say is, the problem is not limited to stealing software. This is not to excuse the low level of morality but to put the problem in proper perspective.

The solution is some kind of method of physically preventing the making of copies, including potential damage to the disk drive. I realize that this is strong medicine, but the disease calls for such a cure. Obviously, this would create a potential problem in making legitimate copies for backup purposes, but certainly vendors can address this by offering two disks within a purchase. Such an arrangement is necessary to protect the purchaser in the event that the vendor drops the product or goes out of business.

—Charles A. Pocatille  
Clifton, NJ

To friends who own Commodores and myself, this trend towards ignoring the home user is puzzling. Each of us spends a great deal of time on the computer. Admittedly, most of the programs in my library are ones I typed in from magazines. I can't afford to spend \$40 or more on computer programs very often. But when I find something that I really want, I save my money and buy it.

The small town computer shop near my home is selling out its Commodore software and will not restock when it is gone. The owner says that no one is buying it anymore. What is really happening is that no one is buying the games and no one can afford \$75 for a utility. All this says to me is that the game players are played out and the only ones left are more serious users, who are beginning to turn to other sources for functional programs.

As long as magazines like *Ahoy!* are around, I say the heck with commercial software makers. They will be left in the dust of the wave of the future. A future with a chicken in every pot, and a computer in every home.

—John J. Hyland, III  
Glassboro, NJ

One of the major problems we who live in small towns have is finding out about and locating new programs and products. We must rely on magazines and friends in other cities to pass new information on to us. Lately it seems that we are seeing fewer advertisements for products. What the problem is I really don't know, but if the dealers and software manufacturers would only find a way to let us know what products they have and provide us with information about them to allow us to make a choice on whether or not to purchase it, they and we would be better off. If we knew what was available, knew where to order it, and if vendors had a good return policy, we would probably be able to purchase more. Is the lack of advertisements because the publishers have raised their

## LEROY'S CHEATSHEET®

KEYBOARD OVERLAYS

### FOR COMMODORE 64™

(VIC-20 also available)

LEROY'S CHEATSHEETS® are plastic laminated keyboard overlays designed for use with popular software and hardware for Commodore's VIC-20 & C-64 computers.

These cut-it-out yourself overlays are designed to fit over the keyboard surrounding the keys with commands and controls grouped together for easy references.

rates too high?

Yes, we do have members who copy programs for others. I would have to say that a large part of this problem would disappear if we had better access to the product and the cost was not so excessive. This copy problem is not as widespread as some magazine articles would have us believe, but it does exist. Relying on mail order almost exclusively is very difficult for us diehard Commodore users.

—Charles T. Cragg  
Havasu Commodore Users Group  
Lake Havasu City, AZ

Let's assume a small percentage of home computer users have to have everything they can get their hands on. I bet you that they will only play their favorites or use what they need. Is their illegally acquired, unused software really a threat or a loss to the manufacturer? That leaves a majority who are specifically inclined, meaning they only pirate what they want. Sadly I must admit there are also those who steal because they want to and have no intention of spending their own money. To those I say, you get back what you give.

Not all software is for everyone. I have pirated software that I didn't keep, and I have purchased software I wish I could get back my money for. It would be wonderful to try software before making the investment or have a 'satisfaction guaranteed or your money back' stip-

ulation. Granted, some companies are service-oriented, but they are a minority.

Then there are the data management problems. Specifically, contingency planning. Most, but not all, companies make it an unnecessary inconvenience to acquire backup copies. Who wants to send a broken diskette away and then wait for a new one to be sent, especially if you're in the middle of a project?

Non-customer service companies and dishonest people are escalating this piracy problem. I suggest my own policy, which is: if you have to, 'borrow' software temporarily, see if it meets your needs, and then purchase it legitimately and/or discard the pirated copy.

I must disagree with your negative prognosis of the Home Computer Industry. Just because the manufacturers aren't socking away a million plus dollars a year?

—R. Scot Derrer  
Walnut Creek, CA

*Why let the controversy end here? We'd be pleased to read, and possibly publish, your views on software piracy and the future of the home computer industry—or on any other subject of interest to Commodore users. ## Ahoy! Kids America

WNYC pioneering radio program for children ages 5-12, "Small Things Considered," has gone national. The corporation for Public Broadcasting (CPB) announced that it will fund the nationwide production, broadcast and market testing of *Kids America* (formerly "Small Things Considered").

*Kids America* is a live, daily children's radio program produced by WNYC-AM, New York City. "Hopefully, *Kids America* will do for radio what Sesame Street and Mr. Rogers' Neighborhood did for public television," said Mary Perot Nichols, director WNYC.

AHOY! salutes WNYC management for this innovative program, C.P.B. for their foresight in supporting this project nationwide and Tom Trocco for his imaginative and unique teaching method used during his computer lesson segments (did you know that looping in computer programming is similar to playing hopscotch?).

The following areas will test market *Kids America*:

San Mateo, CA	KCSM—FM91	Cincinnati, OH	WUXU—FM91.7
Ames, IA	WOI—AM640	Rochester, NY	WXXI—FM91.5
Minneapolis, MN	WSJN—AM1330	Buffalo, NY	WBFO—FM88.7
Milwaukee, WI	WUWM—FM89.7	Boston, MA	WBUR—FM90.9
Macomb, IL	WIUM—FM91.3	New York, NY	WNYC—AM83.7

Time: 6:30 to 8:00 PM EST

Tune in and turn on to *Kids America*.

# PROGRAM LISTINGS

Attention new *Ahoy!* readers! You must read the following information very carefully prior to typing in programs listed in *Ahoy!* Certain Commodore characters, commands, and strings of characters and commands will appear in a special format. Follow the instructions and listing guide on this page.

**O**n the following pages you'll find several programs that you can enter on your Commodore computer. But before doing so, read this entire page carefully.

To insure clear reproductions, *Ahoy!*'s program listings are generated on a daisy wheel printer, incapable of printing the commands and graphic characters used in Commodore programs. These are therefore represented by various codes enclosed in brackets [ ]. For example: the SHIFT CLR/HOME command is represented onscreen by a heart . The code we use in our listings is [CLEAR]. The chart below lists all such codes which you'll encounter in our listings, except for one other special case.

The other special case is the COMMODORE and SHIFT characters. On the front of most keys are two symbols. The symbol on the left is obtained by pressing that key while holding down the COMMODORE key; the symbol on the right, by pressing that key while holding down the SHIFT key. COMMODORE and SHIFT characters are represented in our listings by a lower-case "s" or "c" followed by the symbol of the key you must hit. COMMODORE J, for example, is represented by [c J],

and SHIFT J by [s J].

Additionally, any character that occurs more than two times in a row will be displayed by a coded listing. For example, [3 "[LEFT]"] would be 3 CuRSOR left commands in a row, [5 "[s EP]"] would be 5 SHIFTed English Pounds, and so on. Multiple blank spaces will be noted in similar fashion: e.g., 22 spaces as [22 " "].

Sometimes you'll find a program line that's too long for the computer to accept (C-64 lines are a maximum of 80 characters, or 2 screen lines long; VIC 20 lines, a maximum of 88 characters, or 4 screen lines). To enter these lines, refer to the *BASIC Command Abbreviations Appendix* in your User Manual.

On the next page you'll find our *Bug Repellent* programs for the VIC 20 and C-64. The version appropriate for your machine will help you proofread our programs after you type them. (Please note: the *Bug Repellent* line codes that follow each program line, in the whited-out area, should *not* be typed in. See the instructions preceding each program.)

Also on the following page you will find *Flankspeed*, our ML entry program, and instructions on its use.  Call *Ahoy!* at 212-239-0855 with any problems.

When You See	It Means	You Type	You Will See	When You See	It Means	You Type	You Will See
[CLEAR]	Screen Clear	SHIFT CLR/HOME		[BLACK]	Black	CNTRL 1

				[F8]	Function 8	SHIFT F7	

# IMPORTANT!

Letters on white background are **Bug Repellent** line codes. **Do not enter them!** This and the preceding explain these codes and provide other essential information on entering **Ahoy!** programs. Read these pages **before** entering programs.

## BUG REPELLENT

This program will let you debug any *Ahoy!* program. Follow instructions for VIC 20 (cassette or disk) or C-64.

### VIC 20 VERSION

By Michael Kleinert and David Barron

For cassette: type in and save the *Bug Repellent* program, then type RUN 63000[RETURN]SYS 828[RETURN]. If you typed the program properly, it will generate a set of two-letter line codes that will match those listed to the right of the respective program lines.

Once you've got a working *Bug Repellent*, type in the program you wish to check. Save it and type the RUN and SYS commands listed above once again, then compare the line codes generated to those listed in the magazine. If you spot a discrepancy, a typing error exists in that line. Important: you must use exactly the same spacing as the program in the magazine. Due to memory limitations on the VIC, the *VIC Bug Repellent* will register an error if your spacing varies from what's printed.

You may type SYS 828 as many times as you wish, but if you use the cassette for anything, type RUN 63000 to restore the *Repellent*.

When your program has been disinfected you may delete all lines from 63000 on. (Be sure the program you type doesn't include lines above 63000!)

For disk: enter *Bug Repellent*, save it, and type RUN:NEW [RETURN]. Type in the program you wish to check, then SYS 828.

To pause the line codes listing, press SHIFT.

To send the list to the printer type OPEN 4.4:CMD 4:SYS 828[RETURN]. When the cursor comes back, type PRINT#4:CLOSE 4[RETURN].

### C-64 VERSION

By Michael Kleinert and David Barron

Type in. SAVE. and RUN the *Bug Repellent*. Type NEW. then type in or LOAD the *Ahoy!* program you wish to check. When that's done. SAVE your program (don't RUN it!) and type SYS 49152 [RETURN].

To pause the listing depress and hold the SHIFT key.

Compare the codes your machine generates to the codes listed to the right of the respective program lines. If you spot a difference, an error exists in that line. Jot down the number of lines where

contradictions occur. LIST each line, spot the errors, and correct them.

## FLANKSPEED FOR THE C-64

By Gordon F. Wheat

*Flankspeed* will allow you to enter machine language *Ahoy!* programs without any mistakes. Once you have typed the program in, save it for future use. While entering an ML program with *Flankspeed* there is no need to enter spaces or hit the carriage return. This is all done automatically. If you make an error in a line a bell will ring and you will be asked to enter it again. To LOAD in a program Saved with *Flankspeed* use LOAD "name".1.1 for tape, or LOAD "name".8.1 for disk. The function keys may be used after the starting and ending addresses have been entered.

- f1 - SAVES what you have entered so far.
- f3 - LOADs in a program worked on previously.
- f5 - To continue on a line you stopped on after LOADing in the previously saved work.
- f7 - Scans through the program to locate a particular line, or to find out where you stopped the last time you entered the program. f7 temporarily freezes the output as well.

# THE TORONTO PET USERS GROUP INC.

# TPUG

**A membership in the world's largest Commodore users' group will provide you with:**

- 10 issues of TPUG magazine
- Advice from experts like Jim Butterfield and Elizabeth Deal
- Access to a huge library of outstanding public domain software
- An invitation to attend the Annual TPUG conference, May 25 and 26 in Toronto, Canada, with two full days of seminars on all aspects of Commodore computing.

## JOIN NOW!

I would like to join TPUG as an associate member at a cost of US\$25.00.

Send your cheque, money order or credit card number to:

TPUG Inc.,  
1912A Avenue Road,  
Toronto, Ontario, Canada  
M5M 4A1

```

Bob uses a built-in ROM memory-move routine in lines 10 through 70. Locations 88 and 89 get the address of the destination and plus one, 90 and 91 get the source end plus one, and 95 and 96 get the address of the source start. The screen characters are copied row by row into

a temporary buffer at address 30000 before they are put back onto the screen column by column.

Congratulations to the many other readers who sent solutions to these *Commodores*. Your letters, suggestions, questions, and solutions are always welcome. People with valid solutions who were not mentioned earlier this month include Bill Sherman (Garson, ONT), Michael Springer (Huntington Beach, CA), Jacqueline Callaway (Orange Beach, AL), Gerald Roberts (Green Cove Spgs., FL), G. A. Skaggs (Adelphi, MD), Michael Marron (Stony Brook, NY), Guillermo Gonzalez (Hialeah, FL), Troy Myers (Fort Ashby, WV), Paul M. Lalli (McAlester, OK), Wallace Leeker (Lemay, MO), Len Lindsay (Madison, WI), Terry Moss (Tuskegee Institute, AL), Emru Townsend (Pierrefords, QUE), David Hoffner (Brooklyn, NY), Paul Dawson (Waitsfield, VT), Dale Moose (Plattsburg, NY) and Derrell Harrison (Cabot, AR).

Here is one final program that might provide you with a chuckle. Type this one-liner from Mike Combs (Kansas City, MO) near the middle of the screen (around line 10).

```

1 ?"[HOME][RIGHT][UP][UP][INSERT]":POKE
218,136:RUN

```

Type a line of text on the second line of the screen. Then move to the bottom line of the screen and type RUN. The result is a variation on the *Screen Scramble* theme. It's up to you to figure out what is going on. See you next month. □

## ...CALLING ALL PROGRAMMERS...

Ahoy! is constantly in search of the best Commodore programs being written today. If you have a utility, game, or other type of program that fits that description, in BASIC or machine language, we'd like to see it.

Send a copy of your program on disk or tape, with documentation and a printout, to Ahoy!, 45 West 34th St.—Suite 407, New York, NY 10001. Include a self-addressed envelope with sufficient return postage affixed.

# Why settle for less when you can have Mo?

**Mitey Mo turns your Commodore 64 into a telecommunications giant. It's the best-performing modem with upload/download.**

Mitey Mo is being hailed as "the best price/performance communications package available." Its software has received the endorsement of the U.S. Commodore Users Group, which gives a money-back guarantee to members. It is truly the industry standard, and no wonder. It's the most user-friendly modem you can buy — it will take you online faster and easier than anything else.

Mitey Mo opens up a world of practical and exciting uses for your C-64. It lets you send and receive electronic mail, link up with community bulletin boards, play computer games with people in distant places, tap into library resources, and much more. All at your convenience.

Until Mitey Mo, Commodore's 1650 Automodem was the obvious choice when you went looking for a modem for your computer. Like Mitey Mo, it has "auto answer" — it receives data while unattended. And both modems are "auto dialers" — you dial right on the computer's keyboard. But that's about where the similarity ends.

Mitey Mo can dial up to 9

MODEM FEATURES	MITEY MO	COMMODORE AUTOMODEM
Auto Dial/Answer	YES	YES
Auto Redial	YES	NO
Smart 64 Software	YES	NO
Function Keys		
Programmable	YES	NO
Upload/Download		
Text & X-Modem	YES	NO
VT-52/VT-100 Emulation	YES	NO
Menu Driven	YES	NO
28K Software Buffer	YES	NO
Easy-to-Use Manual	YES	NO
Bell 103 Compatible	YES	YES
Multiple Baud Rates	YES	YES
Cable Included	YES	YES
Single Switch Operation	YES	NO
Warranty	3 years	90 days

**Some mighty interesting features — ours and theirs. Yours to decide.**

numbers sequentially. But suppose you dial a number and find it's busy. Mitey Mo has "auto redial" — it hangs up and redials immediately until it gets through. With the other modem you have to redial each time — and somebody with auto redialing can slip in ahead of you.

Mitey Mo is menu driven. It lists the things

you can do on the screen.

Select a number and you're on your way. Since Automodem isn't menu driven, you'll be hunting through the manual a lot.

With Mitey Mo, your computer's function keys are programmable — you can save yourself plenty

of keystrokes. Not so with the other modem. And only Mitey Mo lets you store data to review or print it later.

Mitey Mo has just one switch, the Smart 64 software does the rest. With the other modem you'll have to remember to check three switches, otherwise you may be answering when you mean to be originating.

Mitey Mo is half the size of the other modem. The very latest technology allows miniaturization and increased reliability, as well. Mitey Mo is so reliable, we gave it a full three-year warranty. The other modem gives 90 days, then you're on your own.

Not only will you find Mitey Mo mighty useful, you'll find it mighty reasonably priced. When you buy it, you'll get \$15 of CompuServe access time and 2 hours of PlayNet free, as well. See your dealer or call us directly to order your Mitey Mo.

# BEACH-HEAD II

FEATURES  
"VOICE  
SIMULATION"  
AND TRUE  
"HEAD TO HEAD"  
TWO PLAYER  
ACTION

By Roger and  
Bruce Carver

The war time drama of the award winning game Beach-Head continues with Beach-Head II, "The Dictator Strikes Back."

Beach-Head II pits allied forces against the cruel dictator, who escaped the destruction of the fortress and fled into the tropical forest with portions of his army and prisoners captured during the land battle. The player must locate and penetrate the heavily armed sanctuary, capture the dictator, and free the prisoners.
