MITSUBISHI MATERIALS

HERRAMIENTAS DE TALADRADO

DIA EDGE

NEW

MITSUBISHI MATERIALS

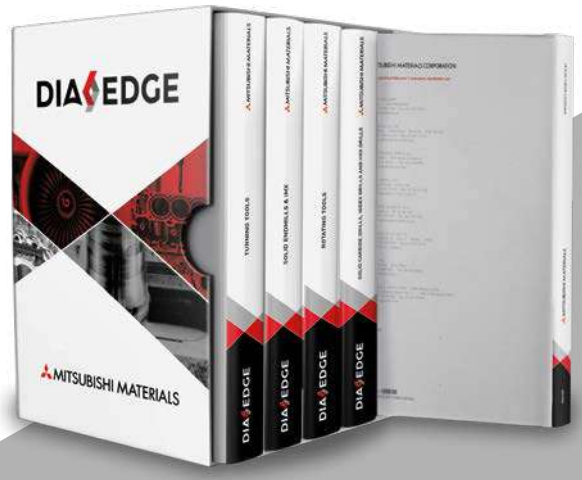
LES PRESENTA SU
NUEVO CATÁLOGO GENERAL C009 – 2022/2023

ESPECÍFICO, COMPACTO, PRÁCTICO.

Los productos de Mitsubishi Materials se mostrarán ahora en catálogos individuales, divididos por gamas de productos para ofrecer a los usuarios un acceso rápido y fácil a la información de los productos que necesiten.

El nuevo catálogo se comprende en los siguientes cinco volúmenes:

- **HERRAMIENTAS DE TORNEADO**
- **HERRAMIENTAS DE TALADRADO**
- **FRESADO INTEGRAL**
- **FRESADO CON PLACAS INTERCAMBIABLES**
- **MPLUS**



NUEVO DISEÑO

MANEJO SENCILLO

MAYOR FLEXIBILIDAD

ÁREAS DE APLICACIÓN INDIVIDUALES

La caja nos permite un fácil almacenamiento y ofrece un espacio para que pueda añadir los próximos catálogos suplementarios, incluidas las novedades que se publicarán dentro de los 2 años de vigencia del catálogo general. Cada catálogo/folleto de novedades actualizará la versión anterior, por lo tanto, puede reemplazar las versiones antiguas si es necesario.

NOTAS:

- Con esta publicación, todos los catálogos generales y catálogos/folletos de novedades anteriores pierden su validez.
- Los catálogos/folletos de novedades de productos se publican dos veces al año, en abril y en octubre.
- El nuevo catálogo general se puede solicitar solo como un conjunto de cinco. **Número de pedido: C009S**

VERSIÓN DIGITAL

Para acceder a la versión digital del catálogo, por favor, escanee el código QR o visite www.mhg-mediastore.net

HERRAMIENTAS DE TALADRADO

RENDIMIENTO: REDEFINICIÓN DE LOS PARÁMETROS

La industria de fabricación moderna avanza con rapidez, por lo que Mitsubishi Materials se esfuerza continuamente por mantenerse al día en el mercado.

En contacto constante con nuestros socios y clientes, ofrecemos soluciones para cualquier situación.

Desde la broca de placa intercambiable MVX para agujeros con una profundidad de hasta 6 x D, hasta la MPS1 de gran profundidad, Mitsubishi Materials cuenta con soluciones individuales para todas las aplicaciones de taladrado.

DIAEDGE

CREAMOS UN FUTURO MEJOR

JUNTO A NUESTROS CLIENTES

Anunciamos el lanzamiento de DIAEDGE, una nueva marca de producto que une nuestras tecnologías avanzadas de corte con la emoción de todos aquellos que las usan.

Nuestro objetivo no es solo ofrecer valor con nuestras herramientas, sino también desarrollar nuevas ideas con nuestros clientes, compartir nuestra inspiración con ellos y seguir afrontando nuevos desafíos.

HERRAMIENTAS DE TALADRADO

COMO INTERPRETAR LA PÁGINA ESTÁNDAR DE BROCAS

●Como está organizada esta página

①Organizada según aplicación para cada broca.

FOTO DE PRODUCTO

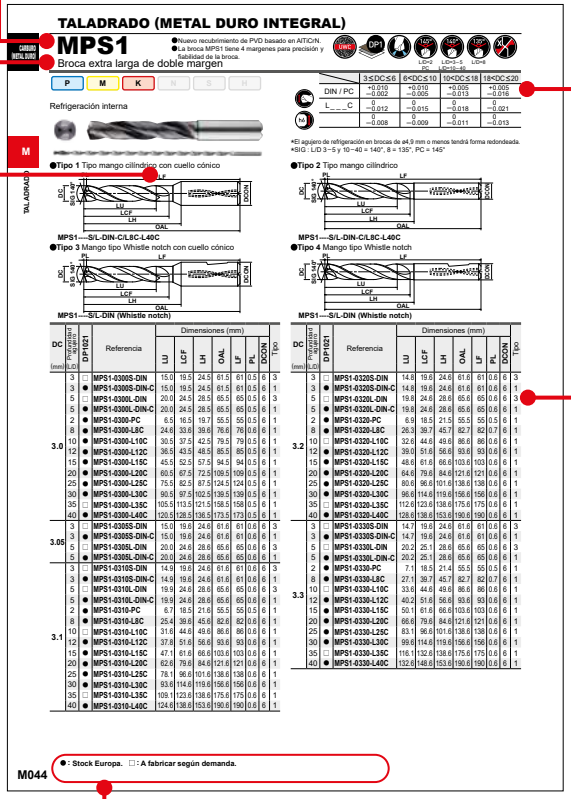
TÍTULO DE PRODUCTO

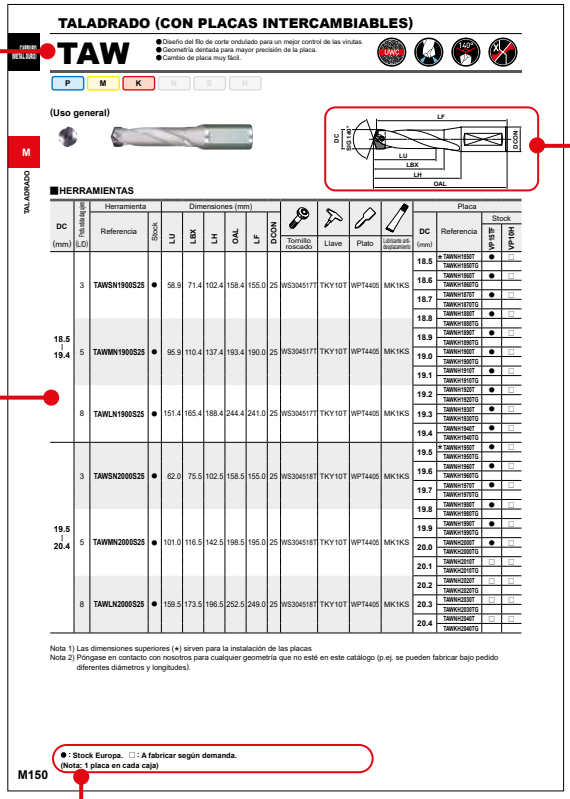
TIPO

TOLERANCIA DIÁMETRO

TÍTULO DE PRODUCTO

GEOMETRIA





PRODUCTO ESTÁNDAR
Indica el diámetro, referencia, situación de stock, número de hélices, dimensiones, según tipo de productos.

LEYENDA PARA SITUACIÓN DE STOCK se muestra en la parte izquierda de cada doble página.

HERRAMIENTAS PARA TALADRAR

*Índice por orden alfabetico

⚠ Las referencias marcadas en gris (MPS, MSL) van a ser descatalogadas y sustituidas por la gama MPS1, por ello le recomendamos cambiar todas las referencias gradualmente en los próximos pedidos.

IDENTIFICACIÓN DEL CÓDIGO DE PRODUCTO

CÓDIGO DE PRODUCTO DE LAS BROCAS

MV **S** **0300** **X** **S**

Nombre de la broca

DLE : Brocas DLE
DSA : Brocas DSAS
DWA : Brocas DWAE
MPS1 : Brocas MPS1
MV : Brocas MVS
MW : Brocas MWS
MF : Brocas MFE
MG : Brocas MGS
MSL : Brocas MSL
MP : Brocas MPS
MA : Brocas MAE/MAS
MS : Brocas MSE
MM : Brocas MMS
MN : Brocas MNS
MH : Brocas MHS
MC : Brocas MC

Tipo de refrigeración

E : Refrigeración externa
S : Refrigeración interna

Diámetro

Ejemplo
0050 → ϕ 0.5
0300 → ϕ 3.0

L/D

S : 2D
M : 3D
L : 5D
(Las brocas MAE / MAS son 6D)
L8C : 8D
L10C : 10D
L12C : 12D
L15C : 15D
L20C : 20D
L25C : 25D
L30C : 30D
L40C : 40D
X : 12D
X8DB : 8D
X10DB : 10D
X15DB : 15D
X20DB : 20D
X25DB : 25D
X30DB : 30D

Tipo de diámetro del mango

A : Mango con el mismo diámetro de la broca
B : Mango con diámetro fijo
C : Tipo mango cilíndrico
S*** : Diámetro del mango

* Excepciones incluidas parcialmente.

VA **PD** **S** **D0050**

Nombre de la broca

VA : Brocas de precisión con recubrimiento Violet (Alto grado, Acero rápido)
V : Brocas Violet

Aplicaciones

SD : Broca recta de uso general
PD : Para mecanizado de alta precisión

Longitud de la hélice

S : Corto
M : Medio

Diámetro

Ejemplo
D0300 → ϕ 3.0
D0050 → ϕ 0.5

* Excepciones incluidas parcialmente.

⚠ Las referencias marcadas en gris (MPS, MSL) van a ser descatalogadas y sustituidas por la gama MPS1, por ello le recomendamos cambiar todas las referencias gradualmente en los próximos pedidos.

DESCRIPCIONES DE LOS SÍMBOLOS

Material

Metal duro de ultra micro-grano
El metal duro de ultra-micrograno se utiliza para las herramientas de corte.

HSS de aleación de alto grado
La HSS de aleación de alto grado se utiliza para las herramientas de corte.

Acero rápido de cobalto
El acero rápido con contenido en cobalto se utiliza como material de sustrato.

Acero rápido
El acero rápido se utiliza como material de substrato.

Núcleo de la broca

Reducción del alma X
La reducción del alma X se utiliza en el filo de corte de la broca.

Reducción del alma Z
La reducción del alma Z se utiliza en el filo de corte de la broca.

Reducción del alma XR
La reducción del alma XR se utiliza en el filo de corte de la broca.

Reducción del alma N
La reducción del alma N se utiliza en el filo de corte de la broca.

Tolerancia

Tolerancia del diámetro de la broca

Tolerancia del diámetro del mango

Agujero de refrigeración

Con agujero de refrigeración

Rango de aplicación según el material de trabajo

1ª Recomendación

P M K N S H

No recomendada

P M K N S H

Recubrimiento

Recubrimiento MIRACLE
Recubrimiento original (Al,Ti)N.
También apto para corte seco.

Recubrimiento PVD
DP102A es una calidad de metal duro convencional recubierto por PVD especializado para brocas de diámetro pequeño, con una resistencia al desgaste mejorada.

Recubrimiento PVD
Ofrece una excelente resistencia al desgaste con un amplio rango de materiales de trabajo; acero, materiales a base de hierro fundido y aleaciones de aluminio.

Recubrimiento PVD
Metal duro convencional de ultramicrograno óptimo para acero inoxidable, y un recubrimiento por PVD con una excelente resistencia al calor y lubricidad.

Recubrimiento PVD
DP9020 ofrece alta resistencia al desgaste y a la rotura, por lo que ofrece una larga vida útil de la herramienta.

Recubrimiento VIOLET
Prolonga la vida de la herramienta 2 o 3 veces más que los productos con recubrimiento TiN.

Recubrimiento de diamante CVD
La tecnología exclusiva multigrano y multicapa de control de cristal de diamante mejora drásticamente la resistencia al desgaste y la suavidad.

Ángulo de filo de corte

Ángulo de la punta
Indica el ángulo de la broca en la punta.

Nota 1) Cuando taladramos agujeros desde 0.3mm se recomienda el uso de una broca punteadora.
Nota 2) Cambiar las condiciones de corte dependiendo de la maquina y de la rigidez del material.
Nota 3) Cuando taladramos agujeros por encima de DCx5, reducir las condiciones.
Nota 4) Se recomienda el uso de fluido soluble en agua (diluido 20 veces) para taladrado utilizando las condiciones de arriba.
Bajar las revoluciones si se utiliza otro tipo de refrigerante.
Nota 5) El material a trabajar marcado por "_" en las condiciones de la tabla de arriba, será complicado taladrarlo con refrigeración interna.
Se recomienda la refrigeración interna en MWS y VAPDSSUS.

MSE

- Ancho de la hélice para prevenir la aglomeración de virutas.
- Estable, pequeños diámetros de mecanizado.

GUIA OPERACIONAL ➤ M016
DATOS TÉCNICOS ➤ P001

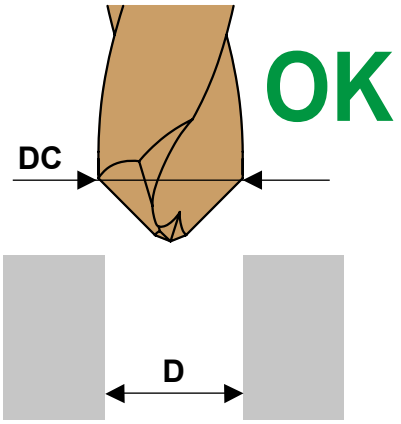
DLE

Serie de brocas destacadas en el mercado

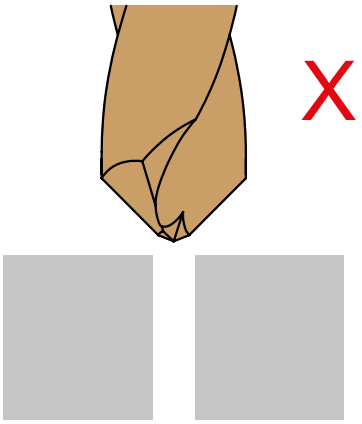
SELECCIÓN DEL DIÁMETRO DE LA BROCA

PARA REALIZAR EL BISELADO

Seleccione el diámetro de la broca (diámetro de corte) **DC e**n relación con el diámetro del agujero guía **D**, dentro de un rango de **D** < **DC** < **2D**.

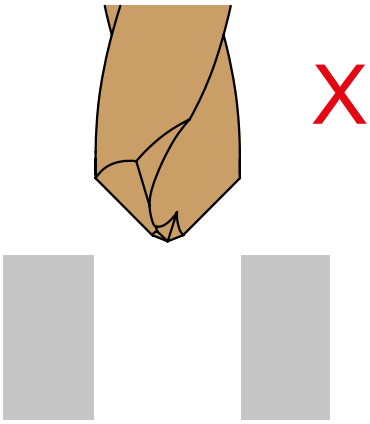


Ejemplo) Si el diámetro del agujero guía **D** es de 5 mm: el diámetro de la broca **DC** debe ser igual o mayor de 6 mm pero menor de 10 mm. Seleccione un **DC** de 6 mm, 7 mm u 8 mm.



Si DC es igual o mayor que 2D:

Si el diámetro de broca **DC** es demasiado grande comparado con el diámetro del agujero guía **D** (igual o mayor que **2D**), no podrá realizarse el biselado.

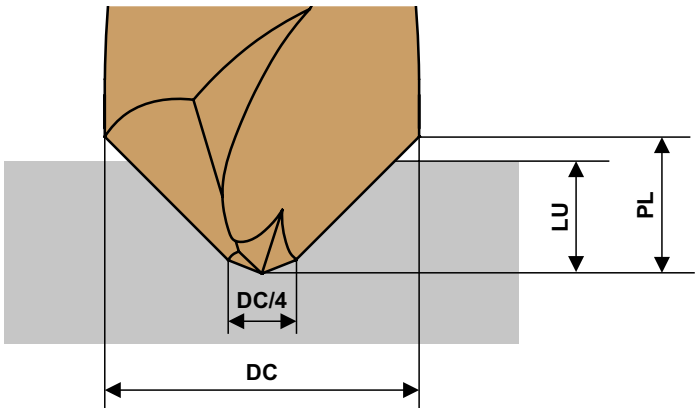


Si DC es un diámetro de broca igual a D:

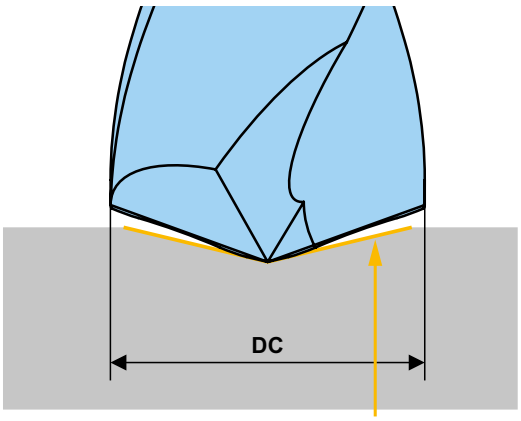
No puede realizarse el biselado si el diámetro de la broca **DC** es igual al diámetro del agujero guía **D**.

PARA REALIZAR EL CENTRADO

El diámetro de centrado debe ser menor que el diámetro de la broca (diámetro de procesamiento) **DC** y la longitud útil **LU** debe utilizarse a modo de guía.
El área central de agujeros (aprox. 25 % del diámetro completo) formada por ángulos de punta de dos pasos no tendrá sus respectivos ángulos de 60º y 90º. El biselado tampoco es posible en las áreas centrales.
Seleccione una broca de centrado con un ángulo de punta más grande que el de la broca de agujero final si desea hacer contacto inicial con el centro.



Siguiente proceso de taladrado



Centrado del ángulo de la punta SIG 145°

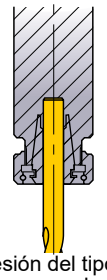
Nota 1) Utilice una herramienta más grande (DC) que el agujero central requerido, pero inferior a 2 x DC.
Nota 2) Reduzca la velocidad de avance cuando centre en superficies en curva o inclinadas.
Nota 3) Reduzca las condiciones de corte cuando realice un ranurado en V o el biselado del borde.
Nota 4) Cuando se generen vibraciones de traqueteo o ruido anómalo, acorte el tiempo de parada o reduzca las revoluciones.
Nota 5) Al realizar el centrado, no supere la LU (longitud útil).

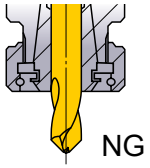
GUIA OPERACIONAL

Amarre de la broca



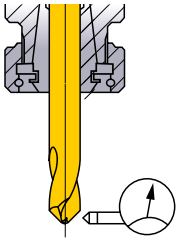
La presión del tipo de tornillo amarra la broca con seguridad.

Longitud de la broca



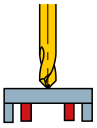
No sujetar en las hélices.

Tolerancia de instalación

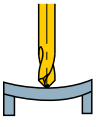


Salto radial
≤ 0.03mm

Pieza delgada

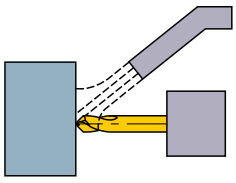


OK
Sujetar la pieza



X
Si se produce un doblamiento

Método de refrigeración



Dos formas de refrigeración, al centro y en la punta.

Punta con ángulo SIG de 90°, 120° y 145°

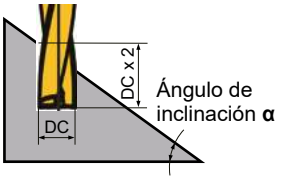
2.95	**≤2**	11600	0.060 (0.040—0.090)



Nota 1) La profundidad recomendada del agujero es DC×2. Esta debería ser la profundidad desde la superficie superior del material de trabajo cuando se trabaje sobre superficies con ángulo. (Consulte el diagrama)

Nota 2) En la tabla de corte anterior se da por hecho que se taladra en una superficie plana.
Para taladrar en superficies anguladas, ajuste la velocidad de avance de acuerdo con el ángulo de inclinación.
Si el ángulo de inclinación α es de 30° o menos, ajuste la velocidad de avance al 70 % o menos como guía.
Si el ángulo de inclinación α es mayor de 30°, ajuste la velocidad de avance al 50 % o menos como guía.

Nota 3) Este producto es una herramienta diseñada para taladrar agujeros. No puede usarse para mecanizado cruzado o helicoidal.

Nota 1) Las condiciones de corte anteriores reflejan el uso de refrigerante hidrosoluble. En el caso del acero inoxidable, se recomienda el uso de refrigerante no hidrosoluble.
Nota 2) Cuando utilice un refrigerante no hidrosoluble, reduzca la velocidad de corte en un 20 % para garantizar una lubricación adecuada.
Nota 3) Compruebe el estado de las virutas y realice el mecanizado por pasos si es necesario. * Referencia de la longitud del paso: de 0,2 a 1,0 DC
Nota 4) Ajuste las condiciones de corte en función de la máquina-herramienta, así como la rigidez de sujeción de la pieza de trabajo, la geometría de mecanizado, etc.
Nota 5) No se recomienda mecanizar a profundidades que excedan la longitud de la hélice (LU).
Nota 6) Sujete la broca de tal forma que la desviación de la misma no supere los 0,03 mm.
Nota 7) No sujete la parte de la hélice de la broca.

DIAEDGE

CREAMOS UN FUTURO MEJOR

JUNTO A NUESTROS CLIENTES

Anunciamos el lanzamiento de DIAEDGE, una nueva marca de producto que une nuestras tecnologías avanzadas de corte con la emoción de todos aquellos que las usan.

Nuestro objetivo no es solo ofrecer valor con nuestras herramientas, sino también desarrollar nuevas ideas con nuestros clientes, compartir nuestra inspiración con ellos y seguir afrontando nuevos desafíos.

MITSUBISHI MATERIALS

HERRAMIENTAS DE TALADRADO

TALADRADO (METAL DURO INTEGRAL)

MINI-MVS

- Filo de corte recto que combina una mejora en la evacuación de las virutas y en la resistencia del propio filo de corte.
- El margen simple permite alcanzar un equilibrio óptimo y una gran precisión en el taladrado de diámetros pequeños.

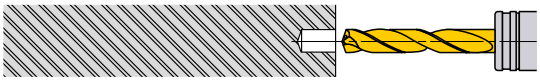
*2= Broca para el agujero guía. Profundidad del agujero de DCx2.

■ INSTRUCCIONES OPERATIVAS PARA LA BROCA LARGA MINI-MVS (L/D ≥ 10)

TALADRADO DE CARA PLANA ● Taladrado de agujero guía

■ 1. Taladrado de agujero guía.

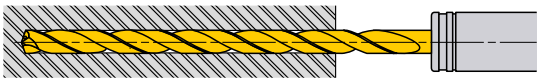


①Utilice una broca con un ángulo de punta mayor (más plano) que el súper-largo. Utiliza si es posible la hélice más corta.
②Asegúrese de taladrar un agujero de alta precisión como guía.
③Profundidad del taladrado: Aprox. 1DC o mayor.
(Ajuste la profundidad del agujero guía según la longitud del modelo súper-largo).

■ 2. Corte inicial con la broca larga

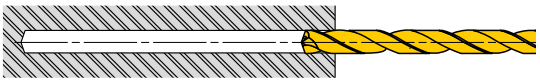
①1. Realice el agujero guía a bajas revoluciones.
(Revoluciones a 1000min^{-1}, vel. avance: 0.2mm－0.3mm/rev)
②Detenga la broca larga a 0.5－1mm del extremo inferior del agujero guía.

■ 3. Taladrado del agujero profundo.



①Comience a cortar a la velocidad y avance recomendados con un ciclo ininterrumpido (avance continuo).

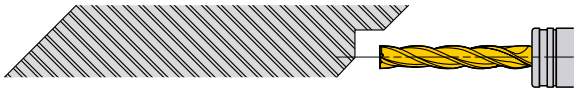
■ 4. Retracción de la broca



①Una vez taladrado, reduzca las revoluciones de corte aprox. a 0.5-1mm. del extremo del agujero. (Revoluciones en torno a 1000min^{-1})
②Retraiga la broca hasta el punto de salida, a la profundidad del agujero guía, con una velocidad de avance de 3,000mm/min.
③Finalmente limpie el agujero con una velocidad de corte de 20-30m/min. y una velocidad de avance de 0.2-0.3mm/rev.

TALADRADO INTERRUMPIDO ● Taladrado e inserción en caras o ángulos irregulares.

■ 1. Refrentado puntual

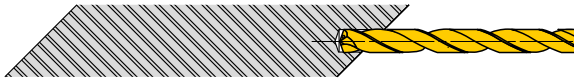


①Mecanice un plano en la cara irregular utilizando una broca o fresa para ranurado capaz de hacer refrentado puntual. El diámetro del punto debe tener el mismo tamaño del agujero profundo requerido.

■ 2. Taladrado de agujero guía

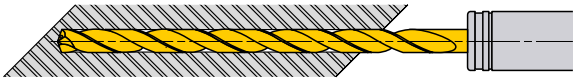
①Utilice una broca con un ángulo de punta mayor (más plano) que el súper-largo. Utiliza si es posible la hélice más corta.
②Asegúrese de taladrar un agujero de alta precisión como guía.
③Profundidad del taladrado: Aprox. 1DC o mayor.
(Ajuste la profundidad del agujero guía según la longitud del modelo súper-largo).

■ 3. Corte inicial con la broca larga



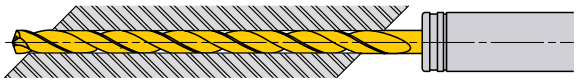
①Efectúe el agujero guía a bajas revoluciones. (Revoluciones a 1000min^{-1} vel. avance: 0.2mm－0.3mm/rev)
②Detenga la broca larga a 0.5－1mm del extremo inferior del agujero guía.

■ 4. Taladre el agujero profundo



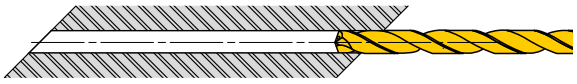
①Comience a cortar a la velocidad y avance recomendados con un ciclo sin perforación (avance continuo).

■ 5. Inserción



①Durante la inserción, el filo de corte puede resultar dañado
②Disminuya la velocidad de avance durante la inserción de la broca.

■ 6. Retracción de la broca



①Finalmente limpie el agujero con una velocidad de corte de 20-30m/min. y una velocidad de avance de 0.2-0.3mm/rev.
②Retraiga la broca hasta el punto de salida, a la profundidad del agujero guía, con una velocidad de avance de 3,000mm/min.

TALADRADO (METAL DURO INTEGRAL)

MINI-MWS

- Micro brocas con refrigeración interior para un taladrado estable de agujeros profundos.
- Para un taladrado eficiente y de alta precisión de aceros al carbono y de materiales de difícil mecanizado.

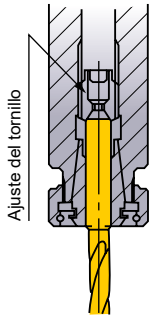
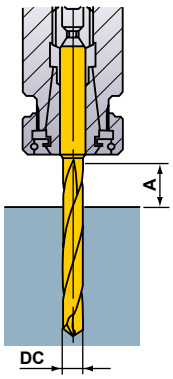
■ GUIA OPERACIONAL

Amarre de la broca



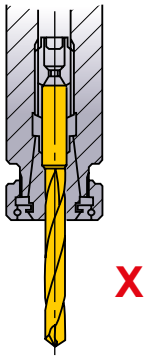
La presión del tipo de tornillo amarra la broca con seguridad.

Longitud de la broca



A ≥ DC x 2.0

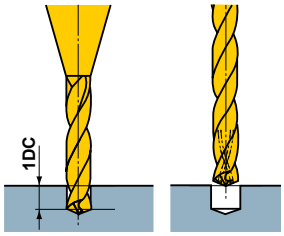
Instalación de la broca



X

No sujetar en las hélices.

Instalación de la broca

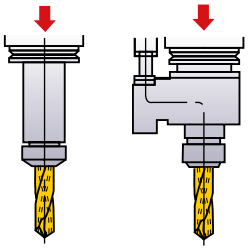


①Para realizar un taladrado previo, utilizar la broca tipo SB.
②Utilizar el agujero previo como una guia, cuando utilizamos una broca con agujero de lubricación. Dependiendo de las condiciones de corte se recomienda punzeado previo.

Tipos de refrigeración

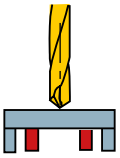
Refriración a traves del husillo

Refriración con máquina revolver



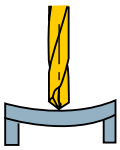
Presión de refrigeración recomendada: ≥30 bar
Se requieren al menos 15 bar.

Pieza delgada



Sujetar la pieza

OK



Si se produce un doblamiento

X

Utilización del refrigerante

1) Pequeñas particulas bloquean el agujero de salida en pqueños diámetros. Utilice siempre un filtro fino como medida preventiva.

2) Pequeñas particulas del aceite viejo ensucian y se adhieren al refrigerante y no permite un flujo eficaz. Se recomienda un cambio regular del aceite.

■ NOTAS DE UTILIZACIÓN

●Por favor utilizar un filtro de malla fina para el refrigerante para prevenir que se bloquee el agujero de aceite refrigerante.

TALADRADO (METAL DURO INTEGRAL)

MPS1

Broca extra larga de doble margen

- Nuevo recubrimiento de PVD basado en AlTiCrN.
- La broca MPS1 tiene 4 margenes para precisión y fiabilidad de la broca.

GUIA OPERACIONAL ➤ M060
DATOS TÉCNICOS ➤ P001

MPS1

Broca extra larga de doble margen

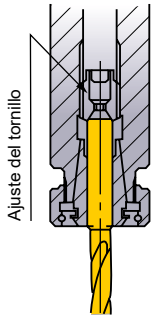
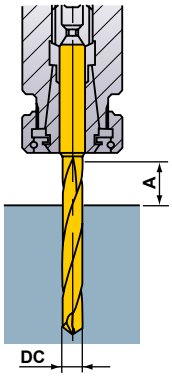
■ INSTRUCCIONES OPERATIVAS PARA LA BROCA LARGA MPS1

Amarre de la broca



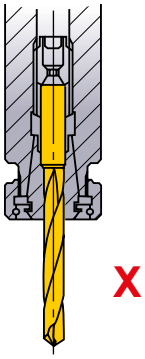
La presión del tipo de tornillo amarra la broca con seguridad.

Longitud de la broca



A ≥ DC x 1.5

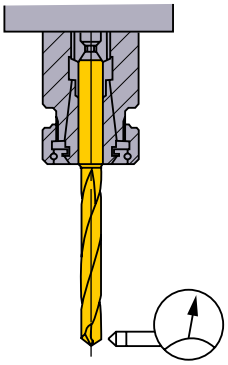
Instalación de la broca



X

No sujetar en las hélices.

Tolerancia de instalación

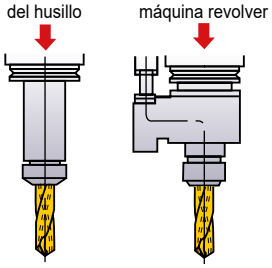


Salto radial ≤ 0.03mm

Tipos de refrigeración

Refriración a traves del husillo

Refriración con máquina revolver



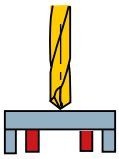
La presión del refrigerante es aproximadamente.
5—10 bar (<ϕ5:2—30 bar).

Utilización del refrigerante

1) Pequeñas particulas bloquean el agujero de salida en pequeños diámetros. Utilice siempre un filtro fino como medida preventiva.

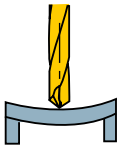
2) Pequeñas particulas del aceite viejo ensucian y se adhieren al refrigerante y no permite un flujo eficaz. Se recomienda un cambio regular del aceite.

Pieza delgada



OK

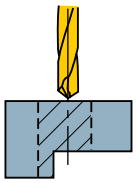
Sujetar la pieza



X

Si se produce un doblamiento

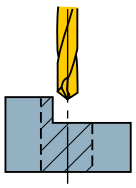
Corte interrumpido



Proceso

OK

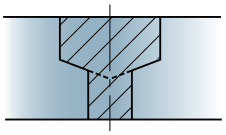
①Bajar el avance cuando taladramos partes en corte interrumpido.



Se requiere mecanizar previamente

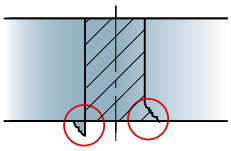
①Refrentar con fresa integral antes de taladrar.

Agujero previo



①Se divide en dos procesos.
②Primero taladrar el agujero grande.
*Una herramienta para ambos mecanizados, chaflanar y refrentar se puede pedir para producir.

Rebabas y astillado en el material

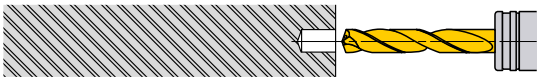


①Bajar el avance a un 50% al final del mecanizado.
②Añadir 45° de chaflan.
③Cambiar el punto del ángulo.

CÓMO UTILIZAR BROCAS DE TIPO LARGO

TALADRADO DE CARA PLANA ● Taladrado de agujero guía

■ 1. Taladrado de agujero guía.

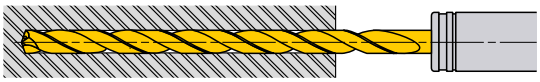


①Utilice una broca con un ángulo de punta mayor (más plano) que el súper-largo. Utiliza si es posible la hélice más corta.
②Asegúrese de taladrar un agujero de alta precisión como guía.
③Profundidad del taladrado: Aprox. 1DC o mayor.
(Ajuste la profundidad del agujero guía según la longitud del modelo súper-largo).

■ 2. Corte inicial con la broca larga

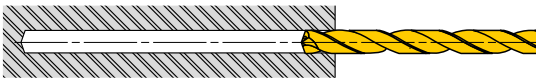
①1. Realice el agujero guía a bajas revoluciones.
(Revoluciones a 1000min^{-1}, vel. avance: 0.2mm－0.3mm/rev)
②Detenga la broca larga a 0.5－1mm del extremo inferior del agujero guía.

■ 3. Taladrado del agujero profundo.



①Comience a cortar a la velocidad y avance recomendados con un ciclo ininterrumpido (avance continuo).

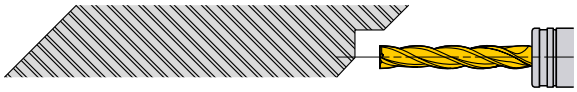
■ 4. Retracción de la broca



①Una vez taladrado, reduzca las revoluciones de corte aprox. a 0.5-1mm. del extremo del agujero. (Revoluciones en torno a 1000min^{-1})
②Retraiga la broca hasta el punto de salida, a la profundidad del agujero guía, con una velocidad de avance de 3,000mm/min.
③Finalmente limpie el agujero con una velocidad de corte de 20-30m/min. y una velocidad de avance de 0.2-0.3mm/rev.

TALADRADO INTERRUMPIDO ● Taladrado e inserción en caras o ángulos irregulares.

■ 1. Refrentado puntual

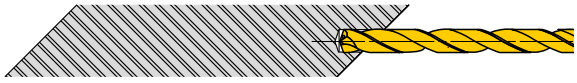


①Mecanice un plano en la cara irregular utilizando una broca o fresa para ranurado capaz de hacer refrentado puntual. El diámetro del punto debe tener el mismo tamaño del agujero profundo requerido.

■ 2. Taladrado de agujero guía

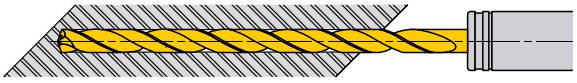
①Utilice una broca con un ángulo de punta mayor (más plano) que el súper-largo. Utiliza si es posible la hélice más corta.
②Asegúrese de taladrar un agujero de alta precisión como guía.
③Profundidad del taladrado: Aprox. 1DC o mayor.
(Ajuste la profundidad del agujero guía según la longitud del modelo súper-largo).

■ 3. Corte inicial con la broca larga



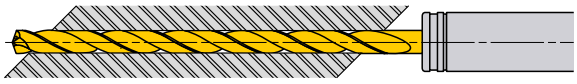
①Efectúe el agujero guía a bajas revoluciones. (Revoluciones a 1000min^{-1} vel. avance: 0.2mm－0.3mm/rev)
②Detenga la broca larga a 0.5－1mm del extremo inferior del agujero guía.

■ 4. Taladre el agujero profundo



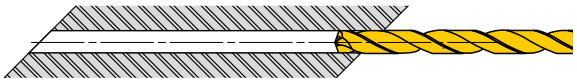
①Comience a cortar a la velocidad y avance recomendados con un ciclo sin perforación (avance continuo).

■ 5. Inserción



①Durante la inserción, el filo de corte puede resultar dañado
②Disminuya la velocidad de avance durante la inserción de la broca.

■ 6. Retracción de la broca



①Finalmente limpie el agujero con una velocidad de corte de 20-30m/min. y una velocidad de avance de 0.2-0.3mm/rev.
②Retraiga la broca hasta el punto de salida, a la profundidad del agujero guía, con una velocidad de avance de 3,000mm/min.

TALADRADO (METAL DURO INTEGRAL)

MPS

Broca extra larga de doble margen

- Desde 3—40 L/D profundidad del agujero.
- La broca MPS tiene 4 margenes para precisión y fiabilidad de la broca.

TALADRADO (METAL DURO INTEGRAL)

MSL

Broca extra larga con doble margen

- Desde 20—30 L/D profundidad del agujero.
- Broca estándar MSL para un taladrado fiable y seguro.

P M K N S H

Refrigeración interna

- Tipo mango cilíndrico

Las condiciones de mecanizado pueden variar bastante, por favor ver la tabla de arriba como referencia de punto de partida y ajustar los valores según las condiciones.

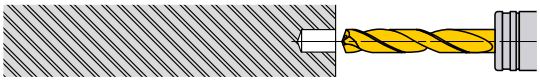
⚠ Las referencias marcadas en gris (MPS, MSL) van a ser descatalogadas y sustituidas por la gama MPS1, por ello le recomendamos cambiar todas las referencias gradualmente en los próximos pedidos.

MPS/MSL

CÓMO UTILIZAR BROCAS LARGA MPS/MSL

TALADRADO DE CARA PLANA ●Taladrado de agujero guía

■ 1. Taladrado de agujero guía.

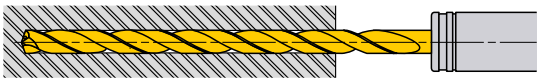


①Utilice una broca con un ángulo de punta mayor (más plano) que el súper-largo. Utiliza si es posible la hélice más corta.
②Asegúrese de taladrar un agujero de alta precisión como guía.
③Profundidad del taladrado: Aprox. 1DC o mayor.
(Ajuste la profundidad del agujero guía según la longitud del modelo súper-largo).

■ 2. Corte inicial con la broca larga

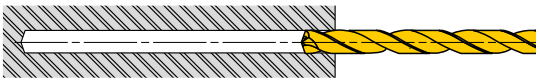
①1. Realice el agujero guía a bajas revoluciones.
(Revoluciones a 1000min^{-1}, vel. avance: 0.2mm－0.3mm/rev)
②Detenga la broca larga a 0.5－1mm del extremo inferior del agujero guía.

■ 3. Taladrado del agujero profundo.



①Comience a cortar a la velocidad y avance recomendados con un ciclo ininterrumpido (avance continuo).

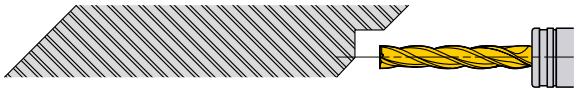
■ 4. Retracción de la broca



①Una vez taladrado, reduzca las revoluciones de corte aprox. a 0.5-1mm. del extremo del agujero. (Revoluciones en torno a 1000min^{-1})
②Retraiga la broca hasta el punto de salida, a la profundidad del agujero guía, con una velocidad de avance de 3,000mm/min.
③Finalmente limpie el agujero con una velocidad de corte de 20-30m/min. y una velocidad de avance de 0.2-0.3mm/rev.

TALADRADO INTERRUMPIDO ●Taladrado e inserción en caras o ángulos irregulares.

■ 1. Refrentado puntual

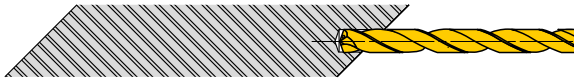


①Mecanice un plano en la cara irregular utilizando una broca o fresa para ranurado capaz de hacer refrentado puntual. El diámetro del punto debe tener el mismo tamaño del agujero profundo requerido.

■ 2. Taladrado de agujero guía

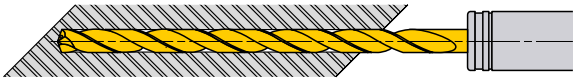
①Utilice una broca con un ángulo de punta mayor (más plano) que el súper-largo. Utiliza si es posible la hélice más corta.
②Asegúrese de taladrar un agujero de alta precisión como guía.
③Profundidad del taladrado: Aprox. 1DC o mayor.
(Ajuste la profundidad del agujero guía según la longitud del modelo súper-largo).

■ 3. Corte inicial con la broca larga



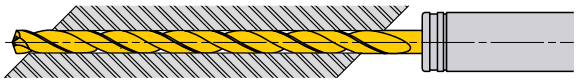
①Efectúe el agujero guía a bajas revoluciones. (Revoluciones a 1000min^{-1} vel. avance: 0.2mm－0.3mm/rev)
②Detenga la broca larga a 0.5－1mm del extremo inferior del agujero guía.

■ 4. Taladre el agujero profundo



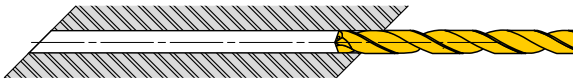
①Comience a cortar a la velocidad y avance recomendados con un ciclo sin perforación (avance continuo).

■ 5. Inserción



①Durante la inserción, el filo de corte puede resultar dañado
②Disminuya la velocidad de avance durante la inserción de la broca.

■ 6. Retracción de la broca



①Finalmente limpie el agujero con una velocidad de corte de 20-30m/min. y una velocidad de avance de 0.2-0.3mm/rev.
②Retraiga la broca hasta el punto de salida, a la profundidad del agujero guía, con una velocidad de avance de 3,000mm/min.

⚠ Las referencias marcadas en gris (MPS, MSL) van a ser descatalogadas y sustituidas por la gama MPS1, por ello le recomendamos cambiar todas las referencias gradualmente en los próximos pedidos.

MICRO-MGS

- Permite taladrados de micro agujeros profundos.
- Una excelente precisión garantiza un taladrado muy preciso.

Nota 1) Para mayor seguridad y mejores resultados, utilice refrigerante a alta presión. (Presión mínima del refrigerante=1000 PSI)
Nota 2) El filtro del refrigerante debe ser de menos de 5 micras.
Es preciso hacer un filtrado fino para evitar que se obstruyan los agujeros del refrigerante.
Nota 3) Es preciso un agujero guía o cepillado guía.
★ : Stock Japón.

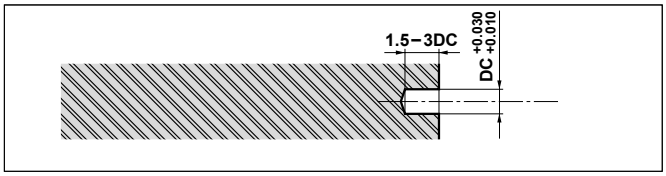
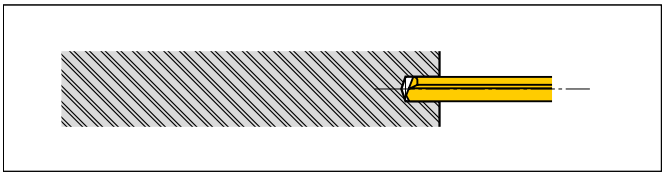
Nota 1) Para mayor seguridad y mejores resultados, utilice refrigerante a alta presión. (Presión mínima del refrigerante=70 bar)
Nota 2) El filtro del refrigerante debe ser de menos de 5 micras.
Es preciso hacer un filtrado fino para evitar que se obstruyan los agujeros del refrigerante.
Nota 3) Es preciso un agujero guía o cepillado guía.

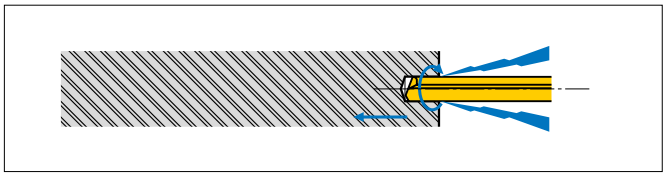
CÓMO SE UTILIZA



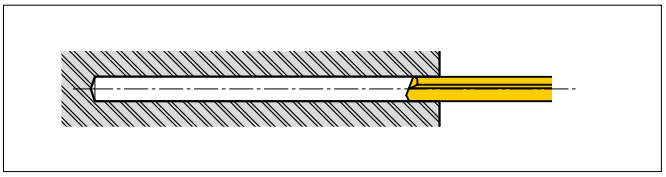
1. Taladrado de agujeros guía.
(Se recomiendan brocas MWE o MWS de Mitsubishi.)



2. Introduzca la broca en el agujero guía sin rotarla o con una rotación inversa por debajo de 300 rpm. Detenga la broca MGS 1-2 mm antes de alcanzar el final del agujero guía.



3. Se acciona el refrigerante, se eleva la velocidad de corte y avance hasta las condiciones de corte recomendadas. A continuación, comienza el taladrado.



4. Tras taladrar vuelve a "Pos 2", desactiva el refrigerante y se detiene la rotación de la broca.

TALADRADO (METAL DURO INTEGRAL)

MMS

- Para un taladrado eficiente y de alta precisión de aceros inoxidables.
- Los agujeros de refrigeración triangulares empiezan desde un diámetro de 4.60 mm.

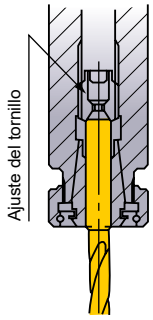
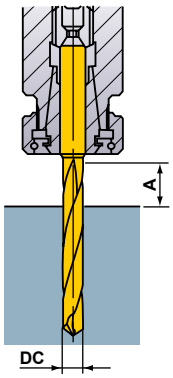
GUIA OPERACIONAL

Amarre de la broca



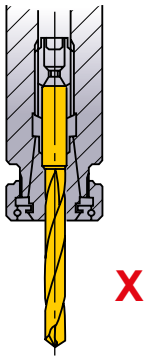
La presión del tipo de tornillo amarra la broca con seguridad.

Longitud de la broca



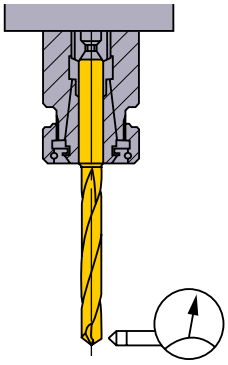
A ≥ DC x 1.5

Instalación de la broca



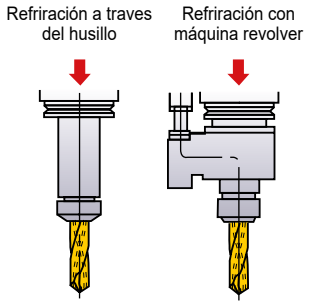
No sujetar en las hélices.

Tolerancia de instalación



Salto radial ≤ 0.03mm

Tipos de refrigeración



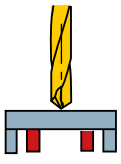
La presión del refrigerante es aproximadamente 5 bar—70 bar

Utilización del refrigerante

1) El polvo y las partículas de polvo que hay en el refrigerante viejo pueden obstruir el agujero para el aceite e impedir el flujo. Es recomendable cambiar regularmente el refrigerante.

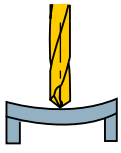
2) Las pequeñas partículas de viruta atascarán el agujero para el aceite. Utilice un filtro como medida preventiva. Si utiliza brocas de pequeño diámetro, utilice un filtro de retícula fina.

Pieza delgada



OK

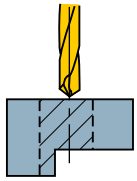
Sujetar la pieza



X

Si se produce un doblamiento

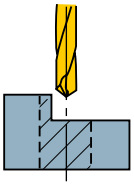
Corte interrumpido



Proceso

OK

①Bajar el avance cuando taladramos partes en corte interrumpido.



Se requiere mecanizar previamente

①Refrentar con fresa integral antes de taladrar.

Nota 1) Para practicar agujeros con estabilidad, es recomendable un sistema de refrigeración por el eje.
Nota 2) Es recomendable utilizar un refrigerante al agua tipo emulsión.
Nota 3) En fluidos de corte que no sean al agua, reduzca la rotación en un 10%—20%.

Nota 1) Para que el taladrado sea estable se recomienda una alta presión de refrigerante a través del husillo.
Nota 2) Se recomienda la refrigeración por emulsión del tipo hidrosoluble.
Nota 3) Al usar refrigerante del tipo no hidrosoluble reduzca la velocidad de corte en un 10-20 %.
Nota 4) Cuando se taladra con un sistema de refrigeración externo, se recomienda el taladrado de avance por pasos en cada profundidad DC x 0,5 para permitir la rotura de las virutas.

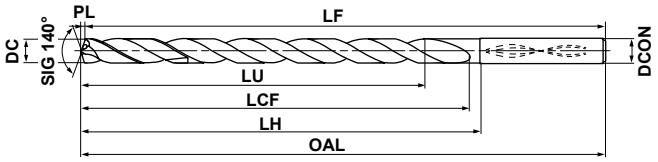
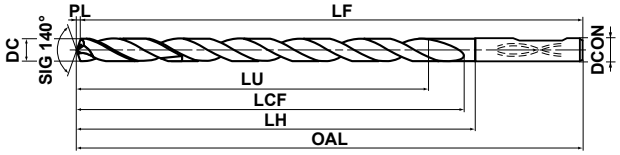
● Las brocas de diámetro 4.5 e inferiores se diseñan con 2 agujeros para el refrigerante.
● Las brocas con un diámetro de 4.6 mm o superior se diseñan con 4 agujeros refrigerantes.

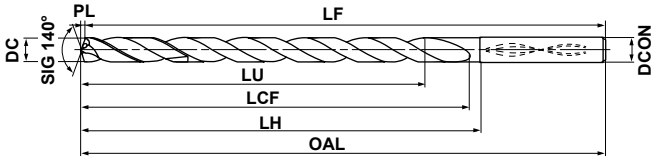
●Tipo 1 **MNS----DIN-C, MNS-C, MNS----LB, MNS----DB** (Tipo mango cilíndrico)



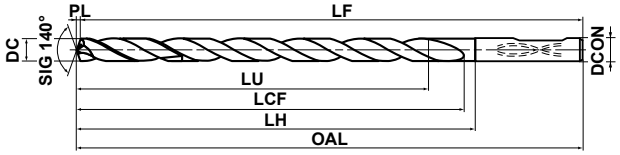
●Tipo 2 **MNS----S/L-DIN** (Mango tipo Whistle notch)



●Tipo 3 **MNS----DIN-C, MNS-C, MNS----LB, MNS----DB** (Tipo mango cilíndrico)



●Tipo 4 **MNS----S/L-DIN** (Mango tipo Whistle notch)



● Las brocas MNS pueden utilizarse con herramientas de amarre por calor.

MNS

CONDICIONES DE CORTE RECOMENDADAS

■ Profundidad agujero : L/D = 3, 5, 8 (Broca tipo LB, S-DIN, S-DIN-C, L-DIN, L-DIN-C, L8C)

Material	N								
	Aleación de aluminio (Si<5%)			Aleación de aluminio (5%≤Si≤10%)			Aleación de aluminio (Si>10%)		
Diámetro Broca **DC** (mm)	Revoluciones (min^{-1})	Avance (min.—max.) (mm/rev)		Revoluciones (min^{-1})	Avance (min.—max.) (mm/rev)		Revoluciones (min^{-1})	Avance (min.—max.) (mm/rev)	
3.2	11900	0.1	(0.11—0.16)	11900	0.15	(0.16—0.21)	11900	0.15	(0.16—0.21)
4.0	9500	0.15	(0.13—0.20)	9500	0.2	(0.20—0.27)	9500	0.2	(0.20—0.27)
5.0	7600	0.2	(0.17—0.25)	7600	0.25	(0.25—0.33)	7600	0.25	(0.25—0.33)
6.3	7500	0.25	(0.21—0.32)	7500	0.35	(0.32—0.42)	7500	0.35	(0.32—0.42)
8.0	5900	0.3	(0.27—0.40)	5900	0.45	(0.40—0.53)	5900	0.45	(0.40—0.53)
10.0	4700	0.4	(0.33—0.50)	4700	0.55	(0.50—0.67)	4700	0.55	(0.50—0.67)
12.0	5300	0.5	(0.40—0.60)	5300	0.7	(0.60—0.80)	5300	0.7	(0.60—0.80)
14.0	4500	0.5	(0.40—0.60)	4500	0.7	(0.60—0.80)	4500	0.7	(0.60—0.80)
16.0	4000	0.5	(0.40—0.60)	4000	0.7	(0.60—0.80)	4000	0.7	(0.60—0.80)
18.0	3500	0.5	(0.40—0.60)	3500	0.7	(0.60—0.80)	3500	0.7	(0.60—0.80)
20.0	3200	0.5	(0.40—0.60)	3200	0.7	(0.60—0.80)	3200	0.7	(0.60—0.80)

Nota 1) Si se utiliza la broca con una longitud superior a L/D 10, es necesario utilizar "agujeros previos" como guía.
(Si no se utiliza un agujero-previo, puede romperse la broca.)
Nota 2) Para taladrar el agujero previo, se recomienda MNS, MAE-MB o MAS-MB.

■ Profundidad agujero : L/D = 10, 12, 15, 20, 25, 30 (Broca tipo X10DB, X20DB, X30DB, L10C, L12C, L15C, L20C, L25C, L30C)

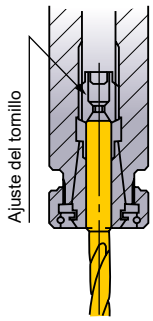
20.0	2500	0.5	(0.40—0.60)	2500	0.7	(0.60—0.80)	2500	0.7	(0.60—0.80)

Nota 1) Si se utiliza la broca con una longitud superior a L/D 10, es necesario utilizar "agujeros previos" como guía.
(Si no se utiliza un agujero-previo, puede romperse la broca.)
Nota 2) Para taladrar el agujero previo, se recomienda MNS, MAE-MB o MAS-MB.

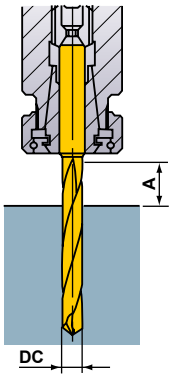
■ GUIA OPERACIONAL DE LA BROCA MNS (L/D 3, 5, 8)

Amarre de la broca



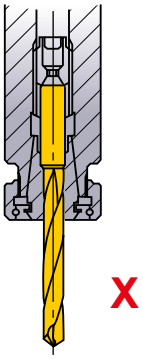
La presión del tipo de tornillo amarra la broca con seguridad.

Longitud de la broca



A : ≥ DC x 1.5

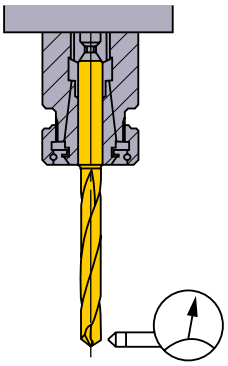
Instalación de la broca



X

No sujetar en las hélices.

Tolerancia de instalación

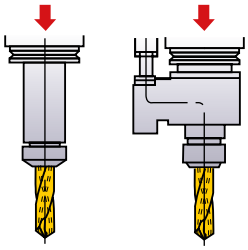


Salto radial ≤ 0.03mm

Método de refrigeración (MNS)

Refriración a traves del husillo

Refriración con máquina revolver



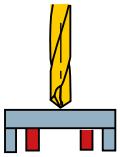
La presión del refrigerante es aproximadamente.
5 bar—70 bar

Utilización del refrigerante

<Tipo **MNS**>

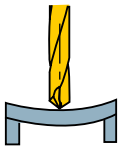
1) El polvo y las particulas de polvo que hay en el refrigerante viejo pueden obstruir el agujero para el aceite e impedir el flujo. Es recomendable cambiar regularmente el refrigerante.
2) Las pequeñas partículas de viruta atascarán el agujero para el aceite. Utilice un filtro como medida preventiva. Si utiliza brocas de pequeño diámetro, utilice un filtro de retícula fina.

Pieza delgada



OK

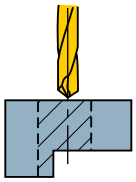
Sujetar la pieza



X

Si se produce un doblamiento

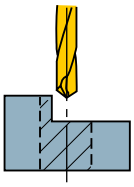
Corte interrumpido



Proceso

OK

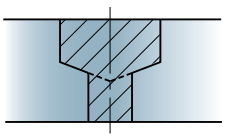
①Bajar el avance cuando taladramos partes en corte interrumpido.



Se requiere mecanizar previamente

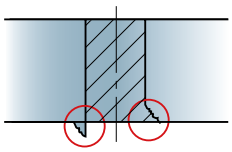
①Refrentar con fresa integral antes de taladrar.

Agujero previo



①Divida el mecanizado en dos procesos.
②Primero taladrar el agujero grande.
*Las herramientas para chaflanado y refrentado especiales se fabrican bajo pedido.

Ruidos y roturas en el material



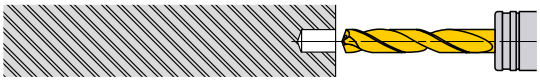
①Reduzca la velocidad de avance al calar.
②Añadir 45º de chaflán.
③Cambiar el punto del ángulo.

MNS

■ GUIA OPERACIONAL DE LA BROCA LARGA DE TIPO MNS (L/D 10, 12, 15, 20, 25, 30)

TALADRADO DE CARA PLANA ● Taladrado de un agujero ciego

■ 1. Taladrado de un agujero previo.

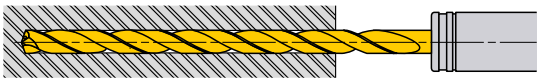


①Para los agujeros guía, recomendamos utilizar brocas Mitsubishi tipo MNS, MAE-MB o MAS-MB.
②Utilizar una broca con el mismo diámetro que la de taladrado profundo.
③Profundidad del agujero guía: mín. 1DC o más profundo.
(Ajuste la profundidad del agujero guía en función de la longitud del tipo largo.)

■ 2. El corte inicial con la broca de tipo largo

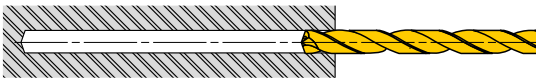
①Entrada en el agujero guía a bajas revoluciones.
(Velocidad de corte 20—30m/min, avance 0.2—0.3mm/rev).
②Detener la broca para agujeros profundos 1—3mm desde la parte de abajo del agujero guía.

■ 3. Taladrado del agujero profundo



①Aumente la velocidad de giro y el avance a un ciclo y taladre hasta la profundidad de taladrado deseada.

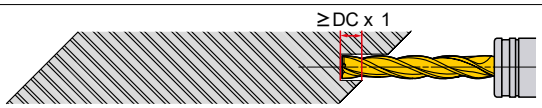
■ 4. Retracción de la broca



①Después del taladrado, reduzca las revoluciones de corte cuando se encuentre aproximadamente a 1—2mm del final del agujero. (Velocidad de corte de aproximadamente 20—30m/min)
②Retire la broca hasta el punto inicial de la profundidad del agujero guía con un avance de 3000 mm/min.
③Por último, retírese del agujero con una velocidad de corte de 20—30m/min y un avance de 0.2—0.3mm/rev.

TALADRADO INTERRUMPIDO ● Taladrado e inserción en caras o ángulos irregulares

■ 1. Refrentado

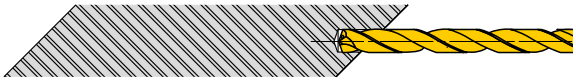


①Al mecanizar un agujero profundo sobre una superficie inclinada, utilice la broca MFE para un agujero guía.
②Asegurarse de que se realiza un agujero de alta precisión para la guía.
③Profundidad de taladrado: Aprox. DC×1.

■ 2. Taladrado de un agujero previo.

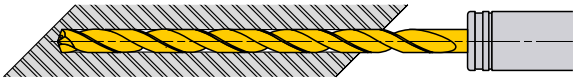
①Para los agujeros guía, recomendamos utilizar brocas Mitsubishi tipo MNS, MAE-MB o MAS-MB.
②Utilizar una broca con el mismo diámetro que la de taladrado profundo.
③Profundidad del agujero guía: mín. 1DC o más profundo.
(Ajuste la profundidad del agujero guía en función de la longitud del tipo largo.)

■ 3. El corte inicial con la broca de tipo largo



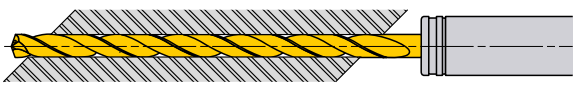
①Entrada en el agujero guía a bajas revoluciones. (Velocidad de corte 20—30 m/min, avance 0.2—0.3mm/rev).
②Detener la broca para agujeros profundos 1—3 mm desde la parte de abajo del agujero guía.

■ 4. Taladrado del agujero profundo



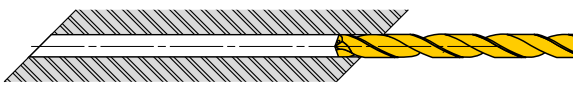
①Aumente la velocidad de giro y el avance a un ciclo y taladre hasta la profundidad de taladrado deseada.

■ 5. Inserción



①Durante la inserción, el filo de corte puede resultar dañado.
②Se recomienda un avance de 0.05mm—0.1mm/rev.

■ 6. Retracción de la broca



①Retire la broca hasta el punto inicial de la profundidad del agujero guía con un avance de 3000mm/min.
②Por último, despeje el agujero con una velocidad de corte de 20—30m/min y un avance de 0.2—0.3mm/rev.

DATOS TÉCNICOS ➢ P001

Notas

TALADRADO (METAL DURO INTEGRAL)

MAE,MAS

- Especializado en taladrado del aluminio y la fundición.
- Gran precisión del agujero.
- Pre-agujero para roscado con macho.
- Refrigeración con agujero helicoidal que permite alta velocidad de mecanizado tipo MAS.

UWC | Solo MAS | 140° | N

P | M | **K** | **N** | S | H

MAE (Refrigeración externa)

MAS (Refrigeración interna)

Nota 1) El tipo MAS tiene mayor diámetro que 5.0 tiene rebajes en la cara final.
Nota 2) Las brocas MAE/MAS pueden utilizarse con herramientas de amarre por calor.

TALADRADO (METAL DURO INTEGRAL)

MHS

- Alta resistencia de retroceso y doble margen exclusivo.
- Perforación ininterrumpida con una larga vida útil de la herramienta para acero de gran dureza, 35-55 HRC.

P M K N S H

Refrigeración interna

- Las brocas MHS pueden utilizarse con herramientas de amarre por calor.
- Utilizar los tipos cortos con sus respectivos diámetros como broca punteadora.

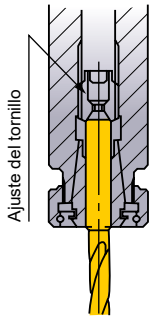
5.0	30	1900	0.080 (0.060−0.100)	150
6.3	30	1500	0.090 (0.080−0.110)	135
8.0	40	1600	0.120 (0.100−0.130)	190
10.0	40	1300	0.150 (0.130−0.170)	195
12.0	40	1100	0.180 (0.150−0.200)	200

Nota 1) Si se utiliza la broca con una longitud superior a L/D 10, es necesario utilizar "agujeros previos" como guía. (Si no se utiliza un agujero-previo, puede romperse la broca.)

Nota 2) Utilizar la broca con la hélice más corta en los respectivos diámetros para realizar el agujero guía.

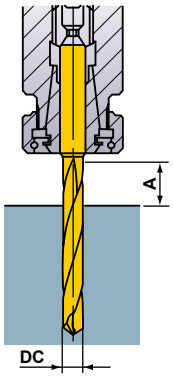
■ GUIA OPERACIONAL

Amarre de la broca



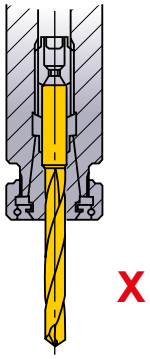
La presión del tipo de tornillo amarra la broca con seguridad.

Longitud de la broca



A ≥ DC x 2

Instalación de la broca

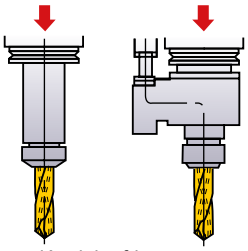


X

No sujetar en las hélices.

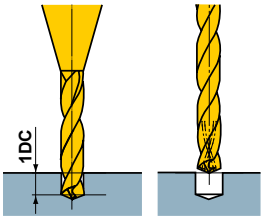
Tipos de refrigeración

Refriración a traves del husillo | Refriración con máquina revolver



La presión del refrigerante es aproximadamente 15 bar—70 bar.
Presión de refrigeración recomendada: ≥30 bar

Instalación de la broca



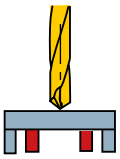
1) Realice un agujero guía de, aproximadamente, 1DC(DC: diámetro de la broca) utilizando la MHS con las hélices más cortas.
2) Utilice el agujero guía a modo de referencia para mecanizar la broca con el agujero de refrigeración. En función de la aplicación, lleve a cabo la perforación oportuna.

Utilización del refrigerante

1) El polvo y las partículas de aceite que hay en el refrigerante viejo pueden obstruir el agujero e impedir el flujo. Es recomendable cambiar regularmente el refrigerante.

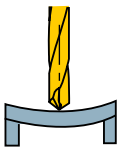
2) Las pequeñas partículas de viruta metálica atascarán el agujero para el aceite. Utilice un filtro como medida preventiva. Si utiliza brocas de pequeño diámetro, utilice un filtro de retícula fina.

Pieza delgada



OK

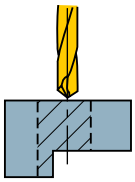
Sujetar la pieza



X

Si se produce un doblamiento

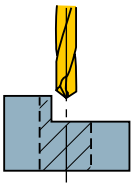
Corte interrumpido



Proceso

OK

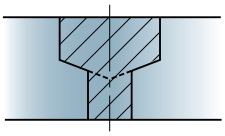
①Bajar el avance cuando taladramos partes en corte interrumpido.



Se requiere mecanizar previamente

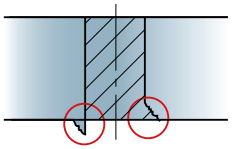
①Refrentar con fresa integral antes de taladrar.

Agujero previo



①Divida el mecanizado en dos procesos.
②Perfore primero el agujero mayor.
*Las herramientas para biselado y refrentado puntual se fabrican por encargo.

Ruidos y roturas en el material



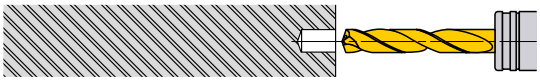
①Reduzca la velocidad de avance al calar.
②Cambiar el punto del ángulo.

MHS

■ INSTRUCCIONES OPERATIVAS PARA LA BROCA LARGA MHS (L/D ≥ 10)

TALADRADO DE CARA PLANA ● Taladrado de agujero guía

■ 1. Taladrado de agujero guía.

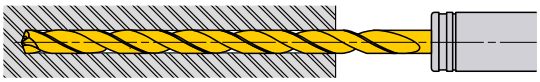


①Utilice una broca con un ángulo de punta mayor (más plano) que el súper-largo. Utiliza si es posible la hélice más corta.
②Asegúrese de taladrar un agujero de alta precisión como guía.
③Profundidad del taladrado: Aprox. 1DC o mayor.
(Ajuste la profundidad del agujero guía según la longitud del modelo súper-largo).

■ 2. Corte inicial con la broca larga

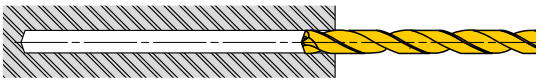
①1. Realice el agujero guía a bajas revoluciones.
(Revoluciones a 1000min^{-1}, vel. avance: 0.2mm－0.3mm/rev)
②Detenga la broca larga a 0.5－1mm del extremo inferior del agujero guía.

■ 3. Taladrado del agujero profundo.



①Comience a cortar a la velocidad y avance recomendados con un ciclo ininterrumpido (avance continuo).

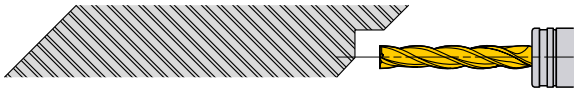
■ 4. Retracción de la broca



①Una vez taladrado, reduzca las revoluciones de corte aprox. a 0.5-1mm. del extremo del agujero. (Revoluciones en torno a 1000min^{-1})
②Retraiga la broca hasta el punto de salida, a la profundidad del agujero guía, con una velocidad de avance de 3,000mm/min.
③Finalmente limpie el agujero con una velocidad de corte de 20-30m/min. y una velocidad de avance de 0.2-0.3mm/rev.

TALADRADO INTERRUMPIDO ● Taladrado e inserción en caras o ángulos irregulares.

■ 1. Refrentado puntual

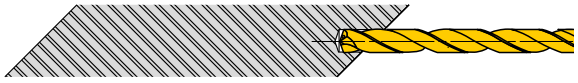


①Mecanice un plano en la cara irregular utilizando una broca o fresa para ranurado capaz de hacer refrentado puntual. El diámetro del punto debe tener el mismo tamaño del agujero profundo requerido.

■ 2. Taladrado de agujero guía

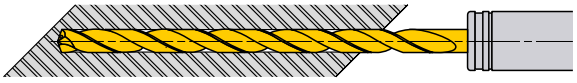
①Utilice una broca con un ángulo de punta mayor (más plano) que el súper-largo. Utiliza si es posible la hélice más corta.
②Asegúrese de taladrar un agujero de alta precisión como guía.
③Profundidad del taladrado: Aprox. 1DC o mayor.
(Ajuste la profundidad del agujero guía según la longitud del modelo súper-largo).

■ 3. Corte inicial con la broca larga



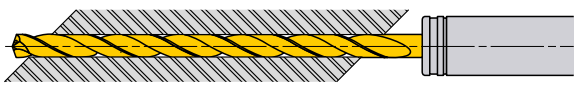
①Efectúe el agujero guía a bajas revoluciones.
(Revoluciones a 1000min^{-1} vel. avance: 0.2mm－0.3mm/rev)
②Detenga la broca larga a 0.5－1mm del extremo inferior del agujero guía.

■ 4. Taladre el agujero profundo



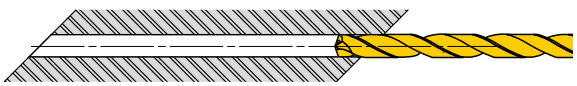
①Comience a cortar a la velocidad y avance recomendados con un ciclo sin perforación (avance continuo).

■ 5. Inserción



①Durante la inserción, el filo de corte puede resultar dañado
②Disminuya la velocidad de avance durante la inserción de la broca.

■ 6. Retracción de la broca



①Finalmente limpie el agujero con una velocidad de corte de 20-30m/min. y una velocidad de avance de 0.2-0.3mm/rev.
②Retraiga la broca hasta el punto de salida, a la profundidad del agujero guía, con una velocidad de avance de 3,000mm/min.

TALADRADO (CON PLACAS INTERCAMBIABLES)

STAW

- Diseño del filo de corte ondulado para un mejor control de las virutas.
- Un sistema de sujeción extremadamente rígido, ofrece estabilidad y fiabilidad en el taladrado de agujeros pequeños.

■ANCHO DE HONING

Si se necesita una placa con honing diferente al estandar,
por favor vea los símbolos de abajo.

(Referencia placa)

S T A W N 1 0 0 0 T ○

- S T A W: Nombre prducto STAW
- N: **N** : Uso general / **K** : Para Fundición
- 1 0 0 0: Diámetro de placa
- T: Símbolo del honing
- ○: Tipo Honing

(Honing estándar)

Tipo Honing	Ancho de corte (mm)
F	0
G	0.02—0.05
H	0.05—0.10
- (Estándar)	0.10—0.15
K	0.15—0.20
S	0.20—0.25
M	0.25—0.30

CONDICIONES DE CORTE RECOMENDADAS

	Material	Diámetro Broca / Condición / Dureza	ϕ10.0—ϕ12.9		ϕ13.0—ϕ13.9		ϕ14.0—ϕ15.4		ϕ15.5—ϕ18.4	
			Velocidad de corte (m/min)	Avance (mm/rev.)	Velocidad de corte (m/min)	Avance (mm/rev.)	Velocidad de corte (m/min)	Avance (mm/rev.)	Velocidad de corte (m/min)	Avance (mm/rev.)
P	Acero dulce	≤180HB	80 (60—100)	0.20 (0.15—0.25)	90 (70—110)	0.25 (0.20—0.30)	100 (80—120)	0.30 (0.25—0.35)	100 (80—120)	0.35 (0.25—0.40)
	Acero al carbono Acero aleado	180—280HB	80 (60—100)	0.20 (0.15—0.25)	90 (70—110)	0.25 (0.20—0.30)	100 (80—120)	0.30 (0.25—0.35)	100 (80—120)	0.35 (0.25—0.40)
		280—350HB	70 (60—90)	0.20 (0.15—0.25)	80 (60—100)	0.25 (0.20—0.30)	90 (70—110)	0.25 (0.20—0.30)	90 (70—110)	0.30 (0.20—0.35)
M	Acero inoxidable	≤200HB	40 (30—50)	0.13 (0.10—0.16)	50 (40—60)	0.15 (0.12—0.18)	60 (50—70)	0.17 (0.14—0.20)	60 (50—70)	0.17 (0.14—0.20)
K	Fundición	Resistencia a la tracción ≤350MPa	80 (60—100)	0.20 (0.15—0.25)	90 (70—110)	0.25 (0.20—0.30)	100 (80—120)	0.30 (0.25—0.35)	120 (80—140)	0.45 (0.35—0.55)
	Fundición dúctil	Resistencia a la tracción ≤450MPa	70 (60—90)	0.20 (0.15—0.25)	80 (60—100)	0.25 (0.20—0.30)	90 (70—110)	0.30 (0.25—0.35)	100 (80—120)	0.35 (0.25—0.40)

Nota 1) Al usar una broca para una profundidad de agujero de Dcx1.5, es posible aumentar la tasa de avance en aprox. un 20 %.
Nota 2) Al usar el portaherramientas de tipo DCx8, reduce la velocidad de corte en un 20 %.
Nota 3) Cuando se utiliza el portaherramientas de tipo DCx8, se recomienda realizar un agujero guía piloto.
Nota 4) Para el acero inoxidable, utilice un refrigerante interno. (No se recomienda la lubricación por pulverización ni MQL).

NOTAS DE UTILIZACIÓN

■INSTALACIÓN DE LA PLACA

1. Antes de introducir la placa compruebe que no hay ningún objeto extraño ni restos de suciedad en la ranura o hendidura del mango. Si es necesario, límpielo con aire comprimido.

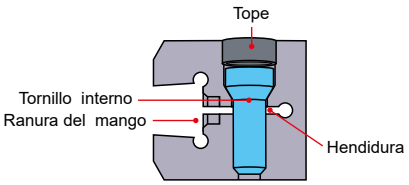
2. Para aflojar el tornillo interno y abrir la boquilla del mango, utilice la llave que se incluye. A continuación coloque la placa en la ranura como indica la figura 1.
   ✱Cuando apriete, compruebe que la llave mantiene firmemente el contacto con la base de la cabeza del tornillo interno.

3. Una vez fijada la placa dentro de la ranura del mango, apriete el tornillo interno empujando al mismo tiempo con suavidad la placa hacia dentro de la cavidad, tal como indica la figura 2, para que quede bien sujeta y centrada.
   ✱Cuando apriete, compruebe que la llave mantiene firmemente el contacto con la base de la cabeza del tornillo interno.

Apriete el tornillo de fijación según el par que se indica a continuación.

Diám. Broca (mm)	Torsión N•m
10 －12.9	1
13 －15.4	2
15.5－18.4	2.5

4. Asegúrese de que no queda ningún espacio hueco entre la base de la placa y la ranura del mango.



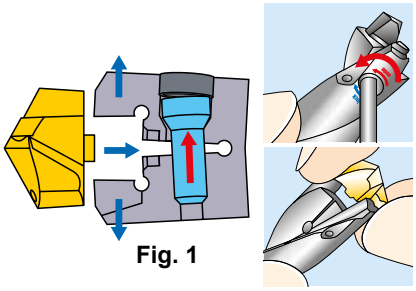


Fig. 1

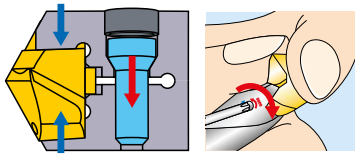

Fig. 2

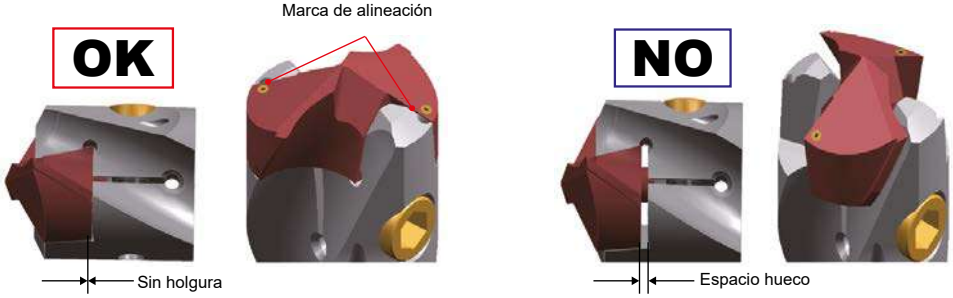

Nota 1) Si las placas están mal o incorrectamente sujetas, puede resentirse su rendimiento en el taladrado e incluso llegar a romperse la broca. Asegurese, por tanto, de que coincidan las marcas de alineación que hay tanto en el cuerpo como en la placa.
A la hora de mecanizar, utilice siempre prendas y gafas de seguridad.

Nota 1) Los respuestos van empaquetados con tornillo, la tuerca interna y el manual. Por favor, reemplazar las piezas, según el manual de instrucciones.

Notas

TALADRADO (CON PLACAS INTERCAMBIABLES)

TAW

- Diseño del filo de corte ondulado para un mejor control de las virutas.
- Geometría dentada para mayor precisión de la placa.
- Cambio de placa muy fácil.

K	Fundición	Resistencia a la tracción ≤350MPa	140 (90—160)	0.35 (0.25—0.40)	140 (90—160)	0.40 (0.30—0.45)
	Fundición dúctil	Resistencia a la tracción ≤450MPa	100 (80—110)	0.30 (0.25—0.35)	100 (80—110)	0.30 (0.25—0.35)

Nota 1) Se recomienda el bruñido tipo H a la hora de mecanizar aceros dulces e inoxidables.
Nota 2) Solo recomendado para el uso de una máquina de gran rigidez. Utilizar el sistema de refrigeración interna cuando mecanizamos el acero inoxidable. (MQL y mist no se debe utilizar)

TAW

■ANCHO DE HONING

Si se necesita una placa con honing diferente al estandar, por favor ver simbolos de abajo.

(Referencia placa)

T A W N H 1 8 5 0 T ○

- T A W: Nombre prducto TAW
- N: **N** : Uso general
- H: **H** : Tipo H
- 1 8 5 0: Diámetro de placa
- T: Símbolo del honing
- ○: Tipo Honing

(Honing estándar)

Tipo Honing	Ancho de corte (mm)
F	0
G	0.02—0.05
H	0.05—0.10
- (Estándar)	0.10—0.15
S	0.20—0.25
M	0.25—0.30

NOTAS DE UTILIZACIÓN

■INSTALACIÓN DE LA PLACA

- Quite el tornillo para instalar la placa. (Placa tipo H)
- Coger la placa con la parte dentada hacia abajo y deslizarla en la ranura del cuerpo de la broca.
- Amarrar la placa roscando el tornillo con la llave especial suavemente como se muestra. (Figura 1)
- Comprobar que entre a la placa y el cuerpo de la fresa no hay ningún hueco. (Figure 2)

Apriete el tornillo de fijación según la torsión que se indica a continuación.

Diám. Broca	Torsión
ø14—ø15	2.0N•m
ø16—ø18	2.0N•m
ø19—ø21	3.5N•m
ø22—ø24	5.5N•m
ø25—ø27	8.5N•m
ø28—ø30	12.0N•m

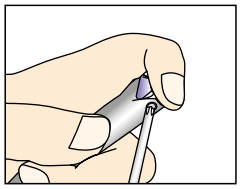

Fig. 1

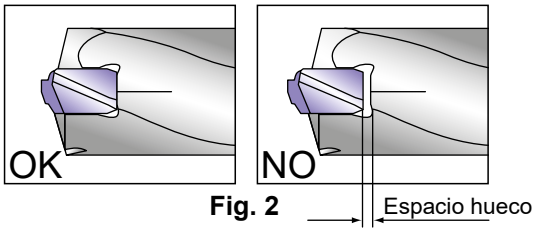

Fig. 2

CAMBIO DE LA PLACA

- Las dientes de la broca deben de estar completamente limpios y tambien el asiento para instalar la nueva broca.

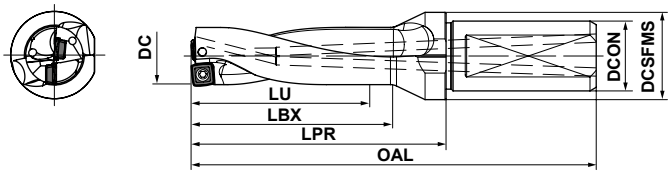
Notas

TALADRADO (CON PLACAS INTERCAMBIABLES)

MVX

- Combinación ideal de placa exterior de CVD y placa interior de PVD.
- Cuerpo de gran rigidez que permite el mecanizado de agujeros con una profundidad L/D=6.

P M K N S H



Desviación máxima durante el torneado

	Tolerancia al mecanizado (guía) (mm)

Nota 1) Reduce un 30 % la velocidad de corte al usar VP15TF como placa exterior.
Nota 2) L/D=3 es la profundidad máxima recomendada si se utiliza refrigerante externo.
Nota 3) La refrigeración interna es necesaria para el taladrado de acero inoxidable.

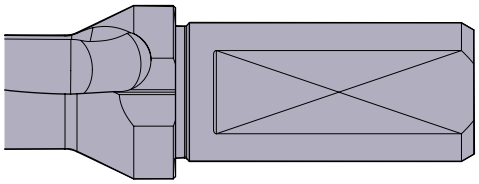
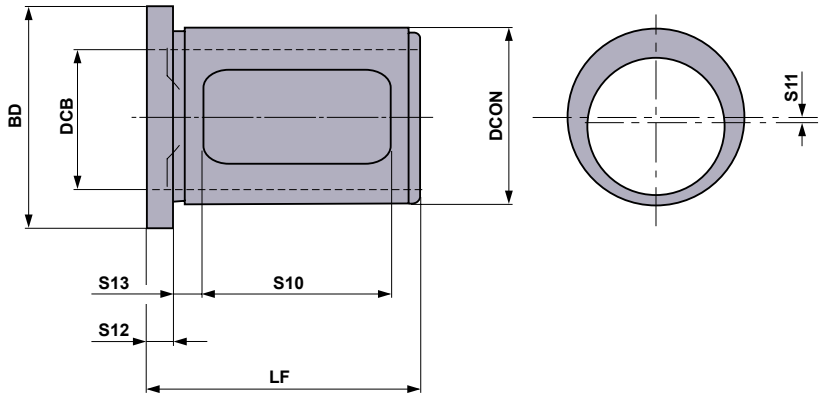
JUST FIT SLEEVE [JFS]

● Casquillo diseñado para conseguir mejores resultados con la broca MVX, permite incrementar el diámetro de la broca en intervalos 0.1mm.





Referencia conjunto	Referencia individual	Stock	Dimensiones (mm)							*Aumento (**S11**×2)	Broca MVX adecuada

No se corresponde con el diámetro del mango de 50 mm.

*Aumento: Tamaño de aumento en el diámetro de corte.

■ GUIA PARA ELEGIR JUST FIT SLEEVE

Diámt. Deseado = Broca ϕ + Incremento de JFS + 0.1mm

(Ej.) El diámetro deseado es 20.3mm la tolerancia que tomamos es de 0.1mm.

ø20.3=(MVX2000 X ◌F25+JFS3225-20)+0.1

- MVX2000 X ◌F25 → Broca de 20mm
- JFS3225-20 → Utilizando JFS un incremento de 0.2mm.
- 0.1 → Voladizo

<Herramienta seleccionada>
Broca : **MVX2000 X ◌F25**
Just fit sleeve (JFS)
: **JFS3225-20**

Nota 1) La tolerancia puede variar debido a las condiciones de corte utilizadas, por favor siga la tabla de arriba.

■ PEDIDOS DE JUST FIT SLEEVE

●Método de compra 1

La tolerancia puede variar en función de las condiciones de corte utilizadas. Por lo tanto, se recomienda comprar como un lote. Cuando haga un pedido, utilice las referencias indicadas. (5 fundas/lote)

●Método de compra 2

Es posible hacer pedidos individualmente. Cuando haga un pedido, utilice las referencias individuales.

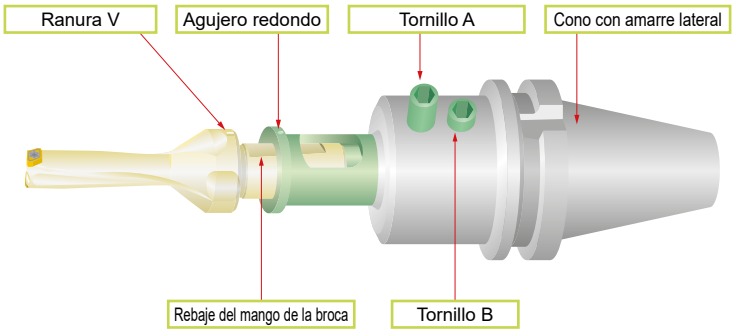
● : Stock Europa. ★ : Stock Japón.

APLICACIÓN DE JUST FIT SLEEVE

1. Cuando coloque la herramienta en el cono de amarre, alinee la ranura V con el filo periférico exterior de la broca, así como los agujeros redondos del eje periférico exterior de la brida del casquillo y los tornillos de amarre para fijar la broca. (Si la broca no tiene ranura V, alinear el rebaje del mango de la broca con los agujeros redondos del casquillo.)

2. Tornillos. A como brida lateral directamente para sujetar amarre de la broca. El tornillo B, solo aprieta a un grado para no dañar el cono.

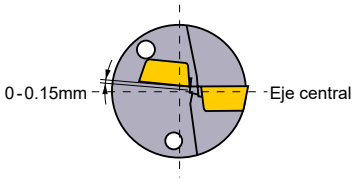
(Nota)
- No se pueden realizar ajustes finos para el diámetro del casquillo.
- No puede utilizarse con herramientas con pinza de sujección.



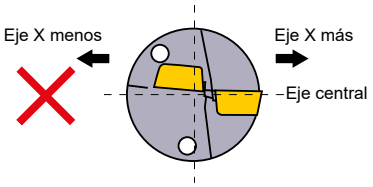
APLICACIÓN DE LA BROCA MVX

●Utilización en un torno

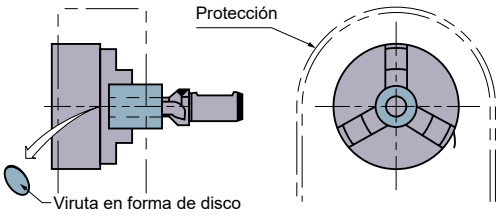
(1) La placa exterior y el eje X de la máquina deben situarse en paralelo. La broca está diseñada de modo que el centro de la placa interior quede 0-0,15 mm más baja al alinear el centro de la broca con el centro del eje de la máquina.
*La placa interior puede romperse si la altura del centro de la placa interior es mayor al eje X de la máquina.



(2) Para ajustar el diámetro del agujero con el desplazamiento de la broca, el filo de corte y el eje de la máquin deben estar en paralelo. Consulte la lista de dimensiones del portaherramientas para conocer la tasa de ajuste máxima de cada portaherramientas.
*No se recomienda ajustar a la dirección menos de eje X (dirección de reducción del diámetro del agujero), ya que el portaherramientas podría interferir con el agujero.



(3) Al taladrar agujeros pasantes en un torno, el disco producido por la broca al salir de la pieza de trabajo puede salir despedida a alta velocidad. Para reducir el peligro de lesiones o daños, se recomienda utilizar una protección.



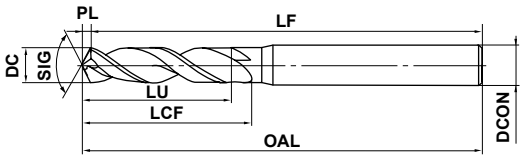
BROCAS VIOLET

VAPDS

Longitud corta, Alta precisión

DC<2 DC≥2

P M K N S H



*LU = LCF-2DC (máx. 3×DC)

0.5≤DC≤3	3<DC≤6	6<DC≤10	10<DC≤13
0 −0.014	0 −0.018	0 −0.022	0 −0.027

* Todas las brocas excepto con intervalos de 0.1mm y por debajo de diam. 2.0mm tienen tolerancia de 0−0.009mm.

● El taladrado de alta eficiencia y la larga vida de la herramienta ha sido mejorarada gracias a la nueva calidad desarrollada Violet.

13.0	980	0.36	860	0.36	490	0.32	440	0.19

Nota 1) Reduzca las revoluciones y el avance en función del taladrado cuando la sujeción del material no tenga la rigidez suficiente o su máquina tenga limitaciones.
Nota 2) Utilice un anillo y un plato de sujeción.
Nota 3) Utilice suficiente fluido de corte.
Nota 4) Cuando taladramos agujeros mayores que 4 x diámetro de la broca, por favor utilizar el avance.
Nota 5) Las condiciones de corte mencionadas más arriba son el estándar cuando se corta en fluido soluble en agua. Reduzca las revoluciones cuando corte en fluido no soluble en agua.

Nota 1) Reduzca las revoluciones y el avance en función del taladrado cuando la sujeción del material no tenga la rigidez suficiente o su máquina tenga limitaciones.
Nota 2) Utilice un anillo y un plato de sujeción.
Nota 3) Utilice suficiente fluido de corte.
Nota 4) Cuando taladramos agujeros mayores que 4 x diámetro de la broca, por favor utilizar el avance.
Nota 5) Las condiciones de corte mencionadas más arriba son el estándar cuando se corta en fluido soluble en agua. Reduzca las revoluciones cuando corte en fluido no soluble en agua.

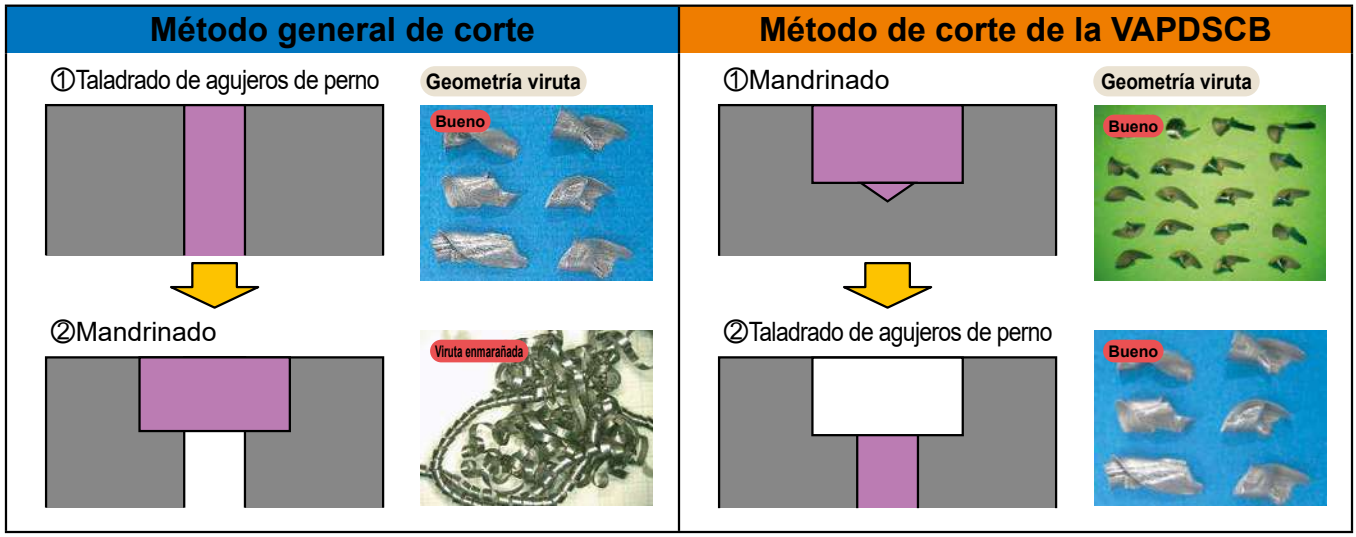
30.0	370	0.37	270	0.37	190	0.34	160	0.18
32.0	350	0.38	250	0.38	180	0.35	150	0.19

Nota 1) Las anteriores condiciones de corte son para perforar a profundidades DCx3, sin agujero previo.
Si hay que perforar agujeros de más de DCx1, se pueden incrementar las RPM en un 20%.
Nota 2) Se recomienda taladrar sin agujero guía.
De lo contrario puede que la viruta no se quiebre. Si necesita romper la viruta, utilice un sistema de avance con pinza.
Nota 3) Para mandrinado de superficies inclinadas es recomendable utilizar brocas de metal duro.
Nota 4) Para mecanizar aceros inoxidables austeníticos (X5CrNi1810), reduzca las revoluciones en un 30 - 60% y reduzca la velocidad de avance en un 40 - 60%.
Nota 5) Utilice un mandril portabroca de pinza.
Nota 6) Reduzca las revoluciones y la velocidad de avance según la situación del fresado, si la instalación de la pieza o la máquina carecen de la suficiente rigidez.
Nota 7) Utilice una cantidad suficiente de fluido de corte.
Nota 8) Las anteriores condiciones le servirán de guía a la hora de utilizar fluido de corte hidrosoluble.
Si emplea fluido no soluble en agua, reduzca las revoluciones.

MÉTODO DE CORTE RECOMENDADO

■ La VAPDSCB consigue un mecanizado altamente eficiente sin que se atasque la viruta.



Nota 1) Si mandrina con la VAPDSCB, es posible que, al realizar un agujero previo se genere viruta continua que puede llegar a enrollarse alrededor de la herramienta.

DATOS TÉCNICOS

CONFORMIDAD CON LA ISO13399

Lista de símbolos de propiedad conforme a la norma ISO13399

Orden alfabético

Fuente: Norma ISO13399
URL : https://www.iso.org/search/x/query/13399

ISO13399 Símbolos de propiedad	Significado
ADJLX	Límite de ajuste máximo
ADJRG	Rango de ajuste
ALF	Ángulo radial de ataque
ALP	Ángulo axial de ataque
AN	Ángulo mayor de ataque
ANN	Ángulo menor de ataque
APMX	Profundidad máxima de corte
AS	Ángulo de ataque del filo de la placa wiper
ASP	Ajuste de la protuberancia del tornillo
AZ	Profundidad máxima de pasada
B	Anchura del mango
BBD	Diseño equilibrado
BCH	Longitud del chaflán en ángulo
BD	Diámetro del cuerpo
BDX	Diámetro máxima del cuerpo
BHCC	Número de agujeros circulares del perno
BHTA	Ángulo de conicidad del cuerpo
BMC	Código del material del cuerpo
BS	Longitud del filo de la placa wiper
BSR	Radio de filo wiper
CASC	Código del tamaño del cartucho
CB	Número de rompevirutas frontal
CBDP	Profundidad del diámetro interior de conexión
CBMD	Denominación de los fabricantes de rompevirutas
CBP	Propiedades del rompevirutas
CCMS	Código de conexión lateral de la máquina
CCWS	Código de conexión lateral de la pieza de trabajo
CCP	Propiedades del chaflán en ángulo
CDI	Diámetro de corte de la placa
CDX	Profundidad máximo de corte
CEATC	Código del tipo de ángulo del filo de corte de la herramienta
CECC	Código de estado del filo de corte
CEDC	Número de filos de corte
CF	Biselado de punto
CHW	Anchura del biselado en ángulo
CICT	Número de elementos de corte
CNC	Número de puntas
CND	Diámetro de la entrada del refrigerante
CNSC	Código del tipo de entrada de refrigerante
CNT	Tamaño de rosca de la entrada del refrigerante
CP	Refrigeración a presión
CRE	Radio de punto
CRKS	Tamaño de rosca de la protuberancia de fijación de la conexión
CSP	Propiedades de suministro de refrigerante
CTP	Propiedades de recubrimiento
CTX	Traslación del punto de corte en dirección X
CTY	Traslación del punto de corte en dirección Y
CUTDIA	Diámetro máximo de corte de la pieza de trabajo
CUB	Base de la unidad de conexión
CW	Anchura de corte
CWX	Anchura máximo de corte
CXD	Diámetro de la salida del refrigerante

ISO13399 Símbolos de propiedad	Significado
CXSC	Código del tipo de salida del refrigerante
CZC	Código del tamaño de la conexión
D1	Diámetro del agujero de fijación
DAH	Diámetro del agujero de acceso
DAXN	Diámetro exterior mínimo de ranurado axial
DAXX	Diámetro exterior máximo de ranurado axial
DBC	Diámetro del círculo de los pernos
DC	Diámetro de corte
DCB	Diámetro del agujero de conexión
DCBN	Diámetro mínimo del agujero de conexión
DCBX	Diámetro máximo del agujero de conexión
DCC	Código del estilo de configuración de diseño
DCCB	Diámetro del avellanador, agujero de conexión
DCIN	Diámetro de corte interno
DCINN	Diámetro de corte interno mínimo
DCINX	Diámetro de corte interno máximo
DCN	Diámetro mínimo de corte
DCON	Diámetro de conexión
DCONMS	Diámetro de conexión, lado de la máquina
DCONWS	Diámetro de conexión, lado de la pieza de trabajo
DCSC	Código de tamaño del diámetro de corte
DCSFMS	Diámetro de la superficie de contacto, lado de la máquina
DCX	Diámetro máxima de corte
DF	Diámetro de la brida
DHUB	Diámetro del buje
DMIN	Diámetro mínimo del agujero
DMM	Diámetro del mango
DN	Diámetro del cuello
DRVA	Ángulo de conducción
EPSR	Ángulo incluido de la placa
FHA	Ángulo helicoidal de la hélice
FHCSA	Ángulo avellanado del agujero de fijación
FHCSD	Diámetro avellanado del agujero de fijación
FLGT	Grosor de la brida
FMT	Tipo de forma
FXHLP	Propiedad del agujero de fijación
GAMF	Ángulo de incidencia radial
GAMN	Ángulo de incidencia normal
GAMO	Ángulo de incidencia ortogonal
GAMP	Ángulo de incidencia axial
GAN	Ángulo de incidencia de la placa
H	Altura del mango
HA	Altura teórica de la rosca
HAND	Mano
HBH	Altura rebajada de la parte inferior de la cabeza
HBKL	Longitud rebajada de la parte posterior de la cabeza
HBKW	Anchura rebajada de la parte posterior de la cabeza
HBL	Longitud rebajada de la parte inferior de la cabeza
HC	Altura real de la rosca
HF	Altura funcional
HHUB	Altura del buje
HTB	Altura del cuerpo
IC	Diámetro de la circunferencia inscrita
IFS	Código del tipo de montaje de la placa
IIC	Código de interfaz de la placa
INSL	Longitud de la placa
KAPR	Ángulo del filo de corte de la herramienta
KCH	Ángulo del biselado del vértice

ISO13399 Símbolos de propiedad	Significado
KRINS	Ángulo mayor del filo de corte
KWW	Anchura de la ranura
KYP	Propiedades de la ranura
L	Longitud del filo de corte
LAMS	Ángulo de inclinación
LB	Longitud del cuerpo
LBB	Anchura del rompevirutas
LBX	Longitud máximo del cuerpo
LCCB	Profundidad del avellanador, agujero de conexión
LCF	Longitud de hélice de virutas
LDRED	Longitud del diámetro del cuerpo reducido
LE	Longitud efectiva del filo de corte
LF	Longitud funcional
LFA	Una dimensión en lf
LH	Longitud de la cabeza
LPR	Longitud del saliente
LS	Longitud del mango
LSC	Longitud de sujeción
LSCN	Longitud mínimo de sujeción
LSCX	Longitud máxima de sujeción
LTA	Longitud LTA (longitud de MCS a CRP)
LU	Longitud útil
LUX	Longitud máxima útil
M	Dimensión-m
M2	Distancia entre el círculo inscrito nominal y la punta de la placa que tiene un ángulo secundario incluido.
MHA	Ángulo del agujero de montaje
MHD	Distancia del agujero de montaje
MHH	Altura del agujero de montaje
MIID	Identificación de la placa maestra
MTP	Código del tipo de sujeción
NCE	Número de corte final
NOF	Número de hélices
NOI	Número de placas
NT	Número de dientes
OAH	Altura total
OAL	Longitud total
OAW	Anchura total
PDPT	Profundidad del perfil de la placa
PDX	Distancia del perfil ex
PDY	Distancia del perfil ey
PFS	Código de tipo de perfil
PL	Longitud de la punta
PNA	Ángulo incluido del perfil
PRFRAD	Radio del perfil
PSIR	Ángulo guía de la herramienta
PSIRL	Ángulo mayor del filo de corte a la izquierda
PSIRR	Ángulo mayor del filo de corte a la derecha
RAL	Ángulo de desprendimiento a la izquierda

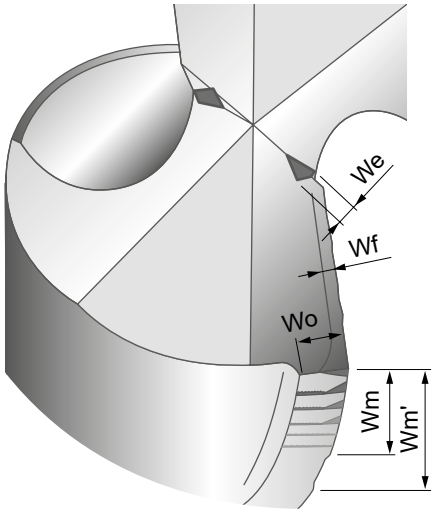
DESGASTE DE LA BROCA Y DAÑOS DEL FILO DE CORTE

■CONDICION DE DESGASTE DE LA BROCA

La tabla de abajo muestra un dibujo sencillo que describe el desgaste de un filo de corte de la broca. La generación y la cantidad de desgaste varían según los materiales de la pieza de trabajo y el estado de los cortes. Pero en general, el desgaste periférico es mayor y determina la vida de la herramienta. Al volver a rectificar, el flanco se desgasta en el punto que tiene que ser rectificado por completo. Por lo tanto, si hay un desgaste mayor hay que eliminar más material para renovar el filo de corte.



We : **Anchura de desgaste del filo de ataque**

Wf : **Desgaste de flanco (El centro del filo de corte)**

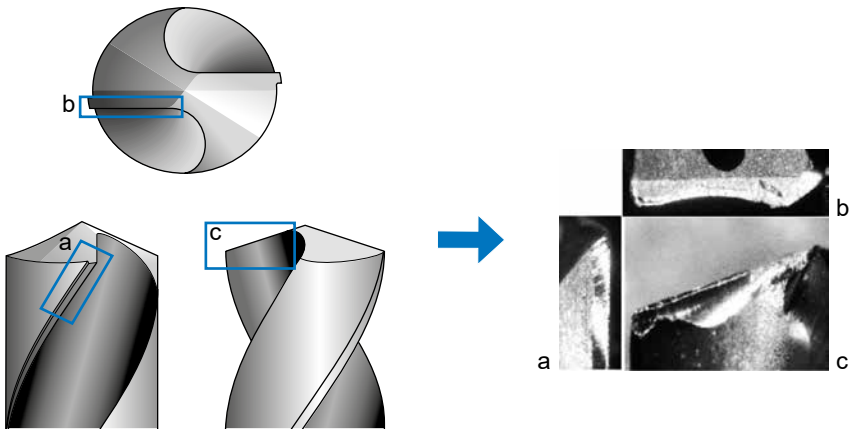
Wo : **Anchura de desgaste de la punta exterior**

Wm : **Anchura de desgaste del margen**

Wm' : **Anchura de desgaste del margen (Borde conductor)**

■DAÑO DEL FILO DE CORTE

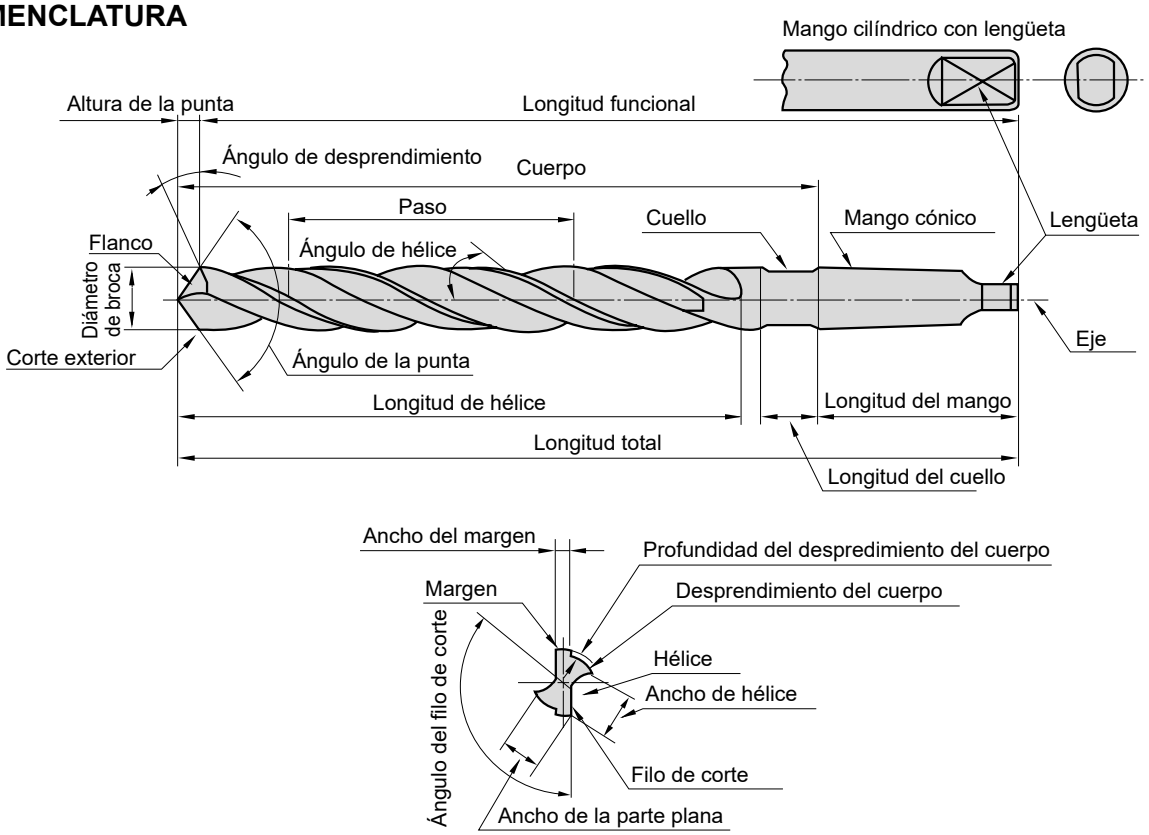
Al taladrar, el filo de corte de la broca puede sufrir astillamiento, roturas y daños anormales. En tales casos, es importante mirar con detalle los daños, investigar la causa y tomar contramedidas.



Daño del filo de corte

CARACTERÍSTICAS Y ESPECIFICACIONES DE LAS BROCAS

■NOMENCLATURA



■ESPECIFICACIONES DE LA FIGURA Y CARACTERISTICAS DE CORTE

Ángulo de hélice	Es la inclinación de la hélice respecto a la dirección axial de una broca; lo que corresponde al ángulo de desprendimiento de una placa. El ángulo de desprendimento de una broca, varía de acuerdo con la posición del filo de corte, y disminuye en cuanto la circunsferencia se aproxima al centro. **Material de gran dureza** **Pequeña** ◀‥ **Ángulo de desprendimiento** ‥▶ **Grande** **Material blando** (Aluminio, etc.)
Longitud de hélice	Está determinada por la profundidad del agujero, longitud del casquillo y limite del reafilado. Ya que tiene una gran influencia en la vida de la broca; es necesario minimizarla tanto como sea posible.
Ángulo de la punta	Un ángulo estándar es 118º y se cambia para adaptarse a diferentes aplicaciones. **Material blando, con buena maquinabilidad.** **Pequeña** ◀‥ **Ángulo de la punta** ‥▶ **Grande** **Para material duro y mecanizado de alta eficiencia**
Espesor del Web	Es un elemento importante, que determina la rigidez y la formación de las virutas en la broca. El espesor del web se ajusta de acuerdo con la aplicación. Baja resistencia de corte Baja rigidez Buena formación de viruta Material con buena maquinabilidad **Delgado** ◀‥ **Espesor del web** ‥▶ **Grueso** Gran resistencia de corte Alta rigidez Mala formación de viruta Material de gran dureza, taladrado de agujeros cruzados, etc.
Margen	La punta determina el diámetro de la broca y tiene la función de guía durante el taladrado. El ancho del margen determina el rozamiento en el taladrado de un agujero. **Mala guía** **Pequeña** ◀‥ **Ancho de margen** ‥▶ **Grande** **Buena guía**
Conicidad del diámetro	Para reducir la fricción dentro del agujero taladrado, la hélice tiene una pequeña conicidad desde la punta hasta el mango. El grado de conicidad se representa normalmente por la reducción del diámetro con respecto de la longitud de la hélice; aproximadamente, 0.04−0.1mm. Se utiliza un valor alto para brocas de alta eficiencia, lo que permite el taladrado de agujeros próximos.

■GEOMETRÍA DEL FILO DE CORTE Y SU INFLUENCIA

Tal como se muestra en la tabla de abajo, es posible seleccionar la geometría del filo de corte más adecuada para las diferentes aplicaciones. Si se selecciona la geometría de filo de corte más adecuada puede obtenerse la mayor eficacia de mecanizado y la mayor precisión del agujero.

●Formas de los filos de corte.

Nombre del afilado	Figura	Características y efecto	Aplicación
Cónica		• El flanco es cónico y el ángulo de desprendimiento, aumenta hacia el centro de la broca.	• Uso general
Plana		• El flanco es liso. • Afilado rápido.	• Principalmente para taladros de diámetro pequeño
Tres ángulos de graduación		• Al no haber filo de corte, los resultados de la fuerza centrípeta es muy elevada y el agujero es más grande de lo normal • Requiere una afiladora especial. • Afilado superficial de tres lados.	• Para operaciones de taladrado que requieren alta precisión del agujero y precisión de posicionamiento.
Punto de la hélice		• Para aumentar el ángulo de ataque cerca del centro de la broca, se recomienda un afilado cónico combinado con una hélice irregular. • Borde de corte tipo S con gran fuerza centripeta y precisión de mecanizado.	• Para taladrado que requiere alta precisión.
Labio radial		• El borde de corte está afilado centrípetamente para dispersar la carga. • Gran precisión de mecanizado y rugosidad de superficie acabada. • Para agujeros pasantes, rebabas pequeñas en la base. • Requiere una afiladora especial.	• Fundición, Aleaciones de aluminio • Para placas de fundición. • Acero
Taladro de punto central		• Esta geometría tiene ángulo de punto de dos etapas para mejor concentricidad y una reducción del choque al sacar la pieza de trabajo.	• Para taladrado de chapa delgada.

■ESPESOR DEL NÚCLEO

El ángulo de desprendimiento del filo de corte, se va reduciendo a medida que nos acercamos al centro; y se transforma en un ángulo negativo en el filo del bisel. Durante el taladrado, el centro de la broca está empujando al material, generando entre el 50−70% del esfuerzo de corte. El espesor del núcleo, es muy importante para la reducción del esfuerzo de corte de una broca, rápida evacuación de las virutas del filo y suave taladrado.

	Figura			
					TIPO X	**TIPO XR**	**TIPO S**	**TIPO N**
Características	Se reduce el empuje sustancialmente, y se mejora en el mecanizado. Esto es efectivo cuando el núcleo es mas bien ancho.	El mecanizado es un poco peor que con el tipo X, pero el filo de corte está más reforzado y se puede aplicar en un mayor tipo de operaciones.	Corte fácil. Forma de mayor utilización.	Es efectivo cuando el núcleo es comparativamente ancho.
Aplicaciones principales	Taladrado en general y de agujeros profundos.	Mayor vida. Taladrado en general y del acero inoxidable.	Taladrado en general del acero, fundición y metales no-férricos.	Taladrado profundo.

CARACTERÍSTICAS Y ESPECIFICACIONES DE LAS BROCAS

■VIRUTAS DE TALADRADO

Tipos de virutas	Figura	Características y fácil clasificación
Espiral cónica		Virutas con forma de abanico, cortadas por el filo y curvadas por las hélices. Se producen virutas de este tipo cuando se taladra material dúctil a baja velocidad. Si las virutas se rompen después de varias vueltas, el resultado es satisfactorio.
Paso largo		Virutas de paso largo, evacuadas sin enrollarse. Fácilmente enrollables en la broca.
Abanico		Esta es una viruta rota por la broca y por la pared del agujero. Se produce cuando el avance es alto.
Segmento		Viruta de forma cónica-espiral; rota justo antes de que se convierta en una de paso largo, por el roce con la pared del agujero. Excelente evacuación y disposición de las virutas.
Zig-zag		Viruta retorcida y plegada por la forma de la hélice y las características del material. Fácilmente produce aglomeración de virutas en la hélice.
Palpador		Virutas rotas por vibración o cuando el material taladrado es rizado por un pequeño radio. El resultado es comparativamente satisfactorio; pero estas virutas, se pueden apelotonar fácilmente.

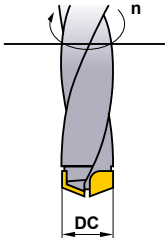
FÓRMULAS PARA TALADRADO

■VELOCIDAD DE CORTE (Vc)

$$Vc = \frac{\pi \cdot DC \cdot n}{1000} \text{ (m/min)}$$

Vc (m/min): Velocidad de corte　**DC (mm)** : Diámetro de broca
π (3.14) : Pi　**n (min^{-1})** : Velocidad del eje principal

*Divida por 1,000 para cambiar de m a mm.



(Ejemplo) ¿Cuál es la velocidad de corte cuando la velocidad del eje principal es 1350min^{-1} y el diámetro de la broca es 12mm ?

(Contestación) Sustituir π=3.14, DC=12, n=1350 en la fórmula.

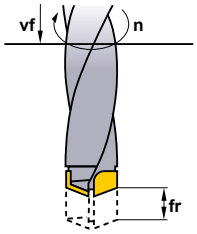
$$Vc = \frac{\pi \cdot DC \cdot n}{1000} = \frac{3.14 \times 12 \times 1350}{1000} = 50.9 \text{m/min}$$

La velocidad es 50.9m/min.

■AVANCE DEL EJE PRINCIPAL (Vf)

$$Vf = fr \cdot n \text{(mm/min)}$$

Vf (mm/min) : Velocidad de avance del eje principal (eje Z)
fr (mm/rev.) : Avance por vuelta
n (min^{-1}) : Velocidad del eje principal



(Ejemplo) ¿Cuál es el avance del eje (Vf) cuando el avance por revolución es 0.2mm/rev. y la velocidad del eje principal es 1350min^{-1} ?

(Contestación) Sustituir fr=0.2, n=1350 en la fórmula.

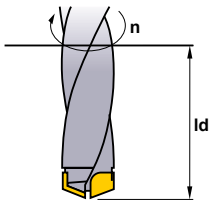
Vf = fr×n = 0.2×1350 = 270mm/min

La avance del eje es 270mm/min.

■TIEMPO DE TALADRADO (Tc)

$$Tc = \frac{ld \cdot i}{n \cdot fr}$$

Tc (min) : Tiempo de taladrado
n (min^{-1}) : Velocidad del husillo
ld (mm) : Profundidad del agujero
fr (mm/rev.) : Avance por vuelta
i : Número de agujeros



n : Velocidad del eje principal

(Ejemplo) ¿Cuál es el tiempo necesario para taladrar un agujero de 30mm de longitud en acero aleado con una velocidad de corte de 50m/min y avance de 0.15mm/rev. ?

(Contestación) Velocidad del husillo $n = \frac{50 \times 1000}{15 \times 3.14} = 1061.57 \text{min}^{-1}$

$$Tc = \frac{30 \times 1}{1061.57 \times 0.15} = 0.188$$

$$= 0.188 \times 60 \fallingdotseq 11.3 \text{ sec}$$

RUGOSIDAD

RUGOSIDAD

(Del JIS B 601-1994)

Tipo	Código	Descripción	Exemple de mesure (Figura)
Rugosidad teórica	Ra	**Ra es el valor obtenido en la fórmula siguiente y expresado en micras. Medida aritmética de los valores absolutos de las desviaciones del perfil, en los límites de la longitud básica. Se expresa y=f (x):** $Ra=\frac{1}{\ell}\int_0^{\ell}\lvert f(x)\rvert dx$	Altura máxima	Rz	**Rz es la distancia máxima entre la línea de cresta mayor y el valle más profundo, tomados en la dirección de la línea principal de la muestra, y expresada en micras (μm).** **Nota) Al calcular Rz, es posible encontrar una porción sin ningún valle o cresta excepcionalmente altos o profundos; lo cual puede ser tomado como un defecto.** $Rz=R_P+Rv$	Valor de la rugosidad en los diez puntos	RZJIS	**RZJIS es la suma de los valores absolutos de las alturas de las cinco crestas (Yp) y de la profundidad de los cinco valles (Yv) más profundos; medidos en dirección vertical de la muestra y expresada en micras (μm).** $RzJIS=\frac{(Yp1+Yp2+Yp3+Yp4+Yp5)+(Yv1+Yv2+Yv3+Yv4+Yv5)}{5}$	 $Yp1, Yp2, Yp3, Yp4, Yp5$:altitudes de los cinco cresta más altas de la porción corespondiente a la longitud de referencia l. $Yv1, Yv2, Yv3, Yv4, Yv5$:altitudes de los cinco valles más profundos de la porción corespondiente a la longitud de referencia l.

■RELACIÓN ENTRE RUGOSIDAD TEÓRICA (Ra) Y DESIGNACIÓN CONVENCIONAL (DATO DE REFERENCIA)

Rugosidad teórica **Ra**		Altura máxima **Rz**	Valor de la rugosidad en los diez puntos **RZJIS**	Longitud de muestreopara **Rz • RZJIS** l (mm)	Marca de acabado convencional
Series estándar	Valor del corte λc (mm)	Series estándar			
0.012 a	0.08	0.05s	0.05z	0.08	▽▽▽▽
0.025 a	0.25	0.1 s	0.1 z		
0.05 a		0.2 s	0.2 z	0.25	
0.1 a	0.8	0.4 s	0.4 z		
0.2 a		0.8 s	0.8 z	0.8	
0.4 a		1.6 s	1.6 z		▽▽▽
0.8 a		3.2 s	3.2 z		
1.6 a		6.3 s	6.3 z		
3.2 a	2.5	12.5 s	12.5 z	2.5	▽▽
6.3 a		25 s	25 z		
12.5 a	8	50 s	50 z		▽
25 a		100 s	100 z	8	
50 a		200 s	200 z		—
100 a	—	400 s	400 z	—	

*La correlación entre los tres, es sólo por conveniencia y no es exacta.
*Ra: La longitud evaluada de Rz y RZJIS, es el valor límite y la longitud del muestreo multiplicadas por 5, respectivamente.

Nota 1) La lista de arriba es la editada en el Libro de los Metales AMS; con la resistencia a la tracción aproximada en valores métricos y la dureza Brinell por encima del valor recomendado.

Nota 2) 1MPa=1N/mm^2

Nota 3) Valores entre son raramente utilizados como referencia. Esta lista ha sido elaborada a partir de las normas JIS del Acero.
